case, swore an affidavit that my appeal of these actions was talen in bad faith which will revoke my informa pauperis status which will result in my having to pay fees I am incapable of paying which will result in the dismissal of my case in the Court of Appeals and will continue to deny me access to U.S.Courts and a jury trial, plus now I am expected to pay the attorney fees of a defendant guilty of treason. Judge Burrell has stated that rulings against in violation of the Constitution of the United States are within the scope of the duties of a judge. So, I guess a judge is not only immune to suit for committing multiple felonies, but is also required by his duties to rule against the Constitution. What government do these judges work for?

3666. Re: blown scanner

Newsgroup: rec.radio.scanner
Date: 1996-11-11 00:00:00 UTC
From: Rich Wells <rjwells@vnet.ibm.com>
Message-ID: <32871DEA.167E@vnet.ibm.com>
Source record: 217930

I would bet on coincedence. How old is your 7100? Perhaps with
too much plugging/unplugging you managed to break a connection
to the BNC connector? If the unit is out of warranty and you
are technically capable, open it up and test for continuity
between the external BNC connections and where the antenna
leads attach to the PC board.

Strong signals,
Rich Wells

: >much in Australia.
: Hello Matthew

: I'm not sure on the dpl but the "pl" is Motorola's way of confusing
: the situation with regards to what the rest of the world knows as
: CTCSS! or Sub Audio!

: CTCSS stands for Continuos Tone Carrier Squelch System. (I'll explain
: that later)

: Motorola call it "Private line" (hence pl) other vendors and suppliers
: may call it "subaudio" - It's all basically the same.

CTCSS is Continuous Tone Controlled Sub-Audible Squelch.
Motorola was the first to use it as a replacement for
"single tone" repeater control which was deemed unreliable.
Motolola trademarked the term Private Line. Other manufacturers
called theirs Channel Guard (GE), Tone Guard (EF Johnson?),
Tone Squelch (Standard), Quiet Channel (RCA), ad nausium.
This tended to create some confusion among customers so
the term CTCSS was adopted as a generic term. The EIA
(Electronic Industries Assoc) ossified the frequencies
into a standard set of 40 tones. Since then, a few other
unofficial frequencies were added.

: >so sensitive that he now has to sell his house and spend money on a suit
: >because people know this info, why was having a _cordless_ phone so
: >important that it superseded all of that? =)
: >
: >

: mot only that, but the attorney (this is all from the newspaper article)
: also advised him to get a cellular phone and a pager so they can be
: "reached at all times".

<shrug> The pager probably would have served the purpose well
enough. After all, it's people like this that give the Radio Free
Wilderness Society a supposed "purpose" <snicker>.

: His wife suffers from "Temporal Limbic Epilepsy,
: which produces siezures and hallucinations, and she is also involved with
: a charge of assault (reduced from attempted murder) in which she reacted
: violently and stabbed some guy with a 12 inch knife.

I suppose she's using her epilepsy as a defense? I hope not. I
have clonic/tonic seizures once every two months, and I haven't stabbed
anyone yet.

But anyway...

: That was what sold him on that model phone. The article then goes on to
: say: "...and for the next 18 months (Mr. Stephens) used the phone
: extensively to discuss sensitive matters with his son, wife, and his
: attorney and doctors. That is until he learned a neighbor was
: eavesdropping with a scanner." Now he is suing both Wal Mart and the
: manufacturer of the phone (BellSouth and US Electronics).

You know, I feel sorry for the guy, but I honestly hope he doesn't
win the case. That's just stupid. And it still doesn't explain why his
need to spend $150 on a cordless phone overrode the need for privacy.

: Don't tell Mr Stephens, but he probably also doesn't know that he can be
: heard on his cellphone, but after all, the ECPA prohibits listening to
: cellphones, so he can rest assured that no one will ever tune in to his
: cellphone, right?? He has absolute security and privacy, thanks to the
: government. By the way, I have a large piece of ocean front property in
: Arizona that I want to sell. It's very cheap...Really!! I have full
: confidence that no one in this NG would ever tune into the 869-894 MHz
: band.

Oh I won't because my scanner's cell-receive is blocked. But that
doesn't mean I won't be scanning the 896-929 MHz region and accidentally

happen upon an "image" frequency that my poorly-filtered,
double-conversion scanner can't seem to block out properly. =)

I have both a cordless phone, and a cheap cord phone. The cordless
phone is wonderful for convinience, but if I wanted to talk
about anything sensitive I would use the cord phone.

Actually I hardly ever use my cord phone as I usually don't care
about who hears what I am saying.

Richard.

: Is this a manager's choice charge, or has Tandy gone back
: to the policy that drew so many flames the first time they
: tried it?

My expereince has been that _some_ managers will offer the catalog
for free as long as you make a purchase about $20 or more. So from what
it seems, RS is putting a $2.95 price tag on the catalog, but the manager
ultimately decides whether that price stands or not.

I've been hearing this for years. Friends that work for State Telecommunications Services say they doubt it. CHP has been changing the configuration of several systems to pipe the mobiles out of the base transmitters (ie: you can finally hear both sides of the conversation on one frequency).

Speaking of which, I'm looking for Southern California CHP frequencies. I'm fairly sure everything I have from Ventura/Kings County North is current, but I'm lacking in the Southern California stuff. Here's what I have, maybe someone could help?

County Town (Stn) Color [Base/Mobile]
Imperial Winterhaven (116) Maroon [42.92/42.74]
Inyo Bishop (72) Red [42.44/42.28]
Los Angeles Antelope Valley (89) Tan [42.42/42.84]
Los Angeles Baldwin Park (81) Orange [42.88/42.66]
Los Angeles Central LA (15) Black [42.46/42.70]
Los Angeles East LA (82) Yellow [42.52/42.30]
Los Angeles El Centro (85) Maroon [42.92/42.74]
Los Angeles Glendale (98) Brown [42.50/42.82]
Los Angeles Malibu (109) Pink [42.44/42.76]
Los Angeles Newhall (78) Tan [42.42/42.84]
Los Angeles Santa Fe Springs (83) Gold [42.12/42.20]
Los Angeles South LA (77) White [42.56/42.72]
Los Angeles Tejon (102) Tan [42.42/42.84]
Los Angeles West LA (79) Pink [42.44/42.76]
Los Angeles West Valley (56) Brown [42.50/42.82]
Orange Capistrano (113) Gray [42.48/42.68]
Orange Santa Ana (86) Purple [42.40/42.16]
Orange Westminster (55) Gray [42.48/42.68]
Riverside Banning (97) Red [42.44/42.28]
Riverside Blythe (6) Red [42.44/42.28]
Riverside Indio (76) Red [42.44/42.28]
Riverside Rancho California(115) Gold [42.12/42.20]
Riverside Riverside (74) Green [42.54/42.24]
San Bernardino Victorville (12) White [42.56/42.72]
San Bernardino Arrowhead (101) Copper [42.60/42.74]
San Bernardino Barstow (73) White [42.56/42.72]

Looking for aircraft frequecies? Airguide Publications Inc.,
sells a small booklet of airport listings that show the
associated radio frequencies. They come in three volumes,
Western, Central and Eastern States. That's the good news.
The bad news is that they cost about $35 bucks a pop!
The GOOD news is that you can find these at thrift shops
and garage sales for about one or two dollars. It's a small
4x5 loose leaf book that's easy to throw in the glove
comparment. It doesn't have to be up to date, because
the info doesn't change all that much, and it's GREAT for
Scannerists.

Here's my experience / observation w/free Radio Shack catalogs:

1. They give away last year's catalog when it is within several weeks
before the next year's catalogs are due to arrive.

2. If you buy a bunch of stuff, or think think you'll probably buy a
lot of stuff, then they might give you a free catalog.

3. The catalog comes with a coupon for an immediate $3 off your
next purchase. For those that think they've gotten a catalog for
free not covered by 1 or 2, check & see if they've taken the
coupon to "pay" for your "free" catalog.

That's what I understand, too. Fortunately, I've experienced only
the slightest intermod (and on only one frequency range) using the
new Icom R8500.

My R8500 has better intermod immunity than my Uniden BC9000XLT.

Don't know of any local LF activity. I've read articles on 1 watt
transmitters in the 160-190 range, but never tried one. The LF
military packet systems don't help flea power experiments.

I have an Opto M1 handi-counter. It works pretty well. It has been able to capture cellphone freqs from passing cars (that have the more powerful phones) on the highway without any special attachments (although I am sure a high pass filter would improve performance). This is a bit more expensive than the cub, but seems to work well.

Pro-51 - 200 Channel Direct Entry Programmable Scanner (Handheld)

Features:

Band Search - scans frequencies for air, fire, weather and marine service without needing to know
the frequencies.

2-Second Scan Delay - delays the scanning mode 2 seconds before moving to the next channel

Memory Backup - keeps stored frequencies for 3 days during power loss

Priority Channel - checks your most important channel every 2 seconds

Ten Channel-Storage Banks - store 20 channels in ten different banks for easy storage

Monitor Memories - store up to ten channels during a frequency search to be transferred to
permanent memory

Hyperscan - scans at a rate of 100 steps per second

Frequencies:

29 - 54 MHZ (Ham, VHF low)
108 - 174 MHz (Ham, Aircraft, Fire)
406 - 512 MHz (VHF hi, government)
806 - 823.9375 MHz (public service, police, fire)
851 - 956 MHz (UHF hi)

Cell phone frequencies can be scanned by using a keyboard (NOT a hardware) modification.
Instructions are included.

This handheld scanner is in excellent condition. It includes all original accessories, box and
manual.

Original price - $499.99+tax
My price - $250 (neg)

If interested, or want more information, please respond by E-mail to tcoles@tor.hookup.net

Source record: 218013

Ive just got a question about repeaters. It may sound a really stupid thing to ask but I am really interested.

How come at the end of a transmission when the radio user 'lets go of the ptt button' the repeater either (depending on repeater listening to) cuts off straight away or still transmits for a short while. Also some go 'beep....beep....beep for a while as well.

Does it depend on the radio used?

What about type of repeater, system etc etc

Any info really appreciated.

Many Thanks

Anything that is intended to be received and decoded on the other end
of a transmission can be descrambled. The issue is one of how much
effort is involved, and weather its worth the effort for what you will
hear!

Hmmmm...I bought one a few weeks ago and have since unplugged
the power source from the back of the unit (while turned on) at least
a dozen times and have not yet lost a programmed/stored frequency.

In Hutchinson, Kansas (50 NNW of Wichita), my fiancee's hometown, there is a Cosmosphere. This place is responsible for the reproduction of original looking equipment used for the movie _Apollo 13_ and home of the _Apollo 13_ Space Capsule.

There is also an SR-71 mounted inside a new wing of the building. It is mounted in a descent fashion. Nose pointed down at a 45 deg. angle to the ground.

Like this:
\
\
\
\
\
X

(Sorry if it's askew due to some windoze protocols)

They just put it there on permanent loan from the Smithsonian musuem. Why Hutchinson, Kansas? This was the only place that would have it on display in an eclosed building.

The made an I-beam frame, and mounted it. Then they built around it.

During Christmas, the plane was covered tightly with blue tarp to protect it from the snow, and the I-beam structure had a Christmas tree on the peak. It was a cool site to see. I have pictures of it.

If you are ever in the Mid-West, plan to make a stop here. Plus, the Apollo 13 Space Capsule is on display due to the fact the this is it's final home.

As for the scanning, you may be able to catch some stealth bomber activity, B-1, or other aircraft.

Dave
(Scanner Flatulaire)

BTW, the showed it on CNN when then pulled it down the street in a residential area just to get it to the cosmosphere. They had to cut some trees down from peoples' yards in order to have enough room for the wingspan (albeit small).

If they are protesting the RF output of a cell tower, maybe they should look at the output of a TV or radio broadcast tower. Cell towers are only 100 watts compared to a TV station with maybe 200,000 watts. It doesn't make much sense.

The radio system where I live has the Motorola Securenet which can be
switched on by the officer or dispatcher to make his/her radion traffic
"secure". When switched all that is heard on the scanner is "static"
while all radios that have the securenet loaded in the radio will hear a
clear transmission.

This is the first move I've seen to block cordless. Are you
sure? The 1997 catalog does not indicate any blocking of
any frequency ranges beside cellular.

Also, does Radio Shack make a Canadian version so those of
us who listen to Canadian non-cordless-telephone
transmissions in the 49 MHz band can continue to do so?

I guess all repeaters are "adjustable" for length of delay. It saves
wear and tear on the transmitter amplifier and relays in high volume
use cities.
Rather than kick-out immediately, it waits for a new signal.

Can't help on the other q's

A static charge can build up on your line,
you should always discharge the line before connecting,
I found this out the hard way on a pro34.
I had it powered up and grabbed my outside arial cord
When I unplugged the whip and plugged in the outside arial,
that was it, I don't understand the hows, but I recommend
to ground the cable before plugging it in.

I also recommend always unplugging when not in use,
electric charges can build outside and fry your frontend,
let alone a bolt of lightning hit it when your not home and
roast your house.

Anyhow good luck,

Did you try another radio on the same arial ??
Maybe a cable problem.

Does your whip work on the scanner ??

What if you bought another spread spectrum phone and dallied with the guts to turn it into a 900 MHz decoding scanner? Possible? I believe we're talking about 20-40 freqs with a dwell of .5 seconds or so and D-to-A conversion. Maybe????

Well, it'll take more than a scanner to hear you on a digital spread spectrum system, but you can still be heard. It is not impossible for someone with the expertise, spare time, and extra cash to modify a similiar phone to receive and decode your conversation if the manufacturer did not take the necessary precautions in their designs against such attempts.

KuoH

Surely a spread spectrum receiver doesn't cost more than a
transmitter-receiver pair. Of course, I am assuming that the
person with the spread spectrum phone, has a method to decode
what he encodes... although I have been known to be wrong in
the past.

3739. AR3000 mods available

THere are ham operators experimenting with spread spectrum
technology, so the equipment is in the hands of at least a
few hobbyists. (Those particular hams are either well off
financially or have the equipment available through their
regular jobs. I'm not one of them.)

>> group.

> So, feel free to show the world how stupid
> and ignorant you really are.

That, Porchnoy, is a very unwise and hurtful thing to say . Indeed it shows YOUR ignorance and stupidity. Please read on.

If you re-read my comments, you will note that I stated that I am dislexic. Indeed very dislexic. I cannot help that. Being dislexic often means that a person literally does not have the ability to recognise a misspelt word even when trying. BUT that does not mean that the person is either ignorant nor stupid. I take exception to your thoughtless comments.

Dislexia is a very real dissability that I and thousand of others have had to suffer all our lives. We do not need idiots like you to show our disability up.

Dislexia manifests itself im many different ways. With me, I get word blindness to the point that even simple words are impssibel for me to spell, then within seconds, I can spell it with no problems at all. Other mafifestations is to reverse figures and letters.
(I have just reread the above paragraph and it shows a classic problem - look at the way I spelt impossible the first time around!)

Porchnoy - you owe me, and thousands of other dilexic folk, an apology.

I am not ashamed of my dislexic disability any more that I am ashamed to display my disabled drivers badge. I don't wear them as a badge, but by the same token I don't expect nor want to be called stupid or ignorant Especilly by folk who know no better!

BTW: for your information, I am the MD (CEO) and Technical Director of a radio communications company and commissioned as an expert witness in a pending legal case. I am involved in forensic investigations of some equipment at the moment. I do not think I would have got to that stage by being stupid and ignorant.

Wow, I have a Radio Shack catalog in front of me which quotes $300 for the Pro-62. Actually I was trying to deide between the BC120XLT and the Pro-63, but if the Pro-62 is only $180, I may go for that. Help!

BTW: I definitely need (at least) 108-137 MHz, but the Pro-62 does not appear to have 108-118 (from RS catalog). Does it?

Yes, I've used on a Mac (Quadra 610) without any difficulty. It runs fast enough, mainly because the program does not permit you to do sophisticated searches. In fact, this is one of the problems with this particularly product. If you want to search for say, state police in your state, you won't be able to. You'll have to do it county by county. I eventually copied it all on the hard disk and used Filemaker Pro to dig the data out the way I wanted (which was to import it into Probe). I also found many typos and generally incorrect information (the town of Natick being spelled Matick, for example). Having a real database to work with allows you to uncover those kinds of gaffes. But hey, the price is certainly right.

If you want computer control, it's worth it, since you have no
alternatives. The last I checked they were selling for $200. The secondary
benefit is that you can get cell freqs with the "unlock code." I wrote a
computer-aided scanning FAQ a while back that includes the code.

Jim,

For someone new to the hobby, the Pro-62, currently on sale for
$199.99 is not only a good buy, but the best of the current Radio
Shack hand held offerings, in my opinion.

The scanner is a super clean receiver, simple to use, and covers all
the most important bands.

If you were lucky enough to get a 10% discount "thank you" card in the
mail from the Shack....the Pro-62 will cost you $180.00!

EXCELLENT price for a brand new, excellent little scanner...

The only thing that I see anyone protesting is cell towers. We have communities in this area that don't want them in their neighborhood. It seems however that the people complaining the most are the ones that use the phones (Yuppy beamer types).

I did see a news story a while back on how they are now making cell towers look like trees. Would this solve all our problems? Provide additional nesting spots for spotted owls? How could RFWS (if this is legit) protest this?

Where I live we are on 800 MHz trunked system and also have Motorola's SECURENET installed on the system. The police that use the radio system have the ability to switch to securenet on their radio. When they are transmitting on securenet, all that I can hear on my scanner is "static".

I am wondering if anyone out there knows about the Motorola Securenet system and if there is any way to decode or descramble it on a scanner. Any help with this would be most appreciated.

Thanks,
Bulldog

Who was the rocket scientist that came up with the beehive logo? Geez.
I'm going off my book of all the Highway Patrols, and it shows a number
of UHP cars with lights, but also a few without. I'd assume that it's
similar to the CHP here in CA, where some have lights, some don't.

MA>Ace is apparently selling a RELM scanner (handheld with 200 channels
MA>and PL decoding). Price is $260. Never heard of the brand. Anyone
MA>have thoughts on this company or its products? Info on scanner is
MA>available at the Ace's web site. I'm sorry I can't seem to find the
MA>URL.

RELM is the company that was left after Regency sold their scanner division to Uniden. For several years all they concentrated on was two way radio. There may even have been a non competition clause that required them to stay out of the scanner market for several years. However, they are now back.

I saw a fact sheet on the radio the other day and it looks pretty good. Briefly, in addition to the 200 channels and PL, it features DPL, 10 priorities, with hierarchy, direct channel access, search, search hold, delay, 100 channel/second scan, LCD display, uses 4 AA batteries, AC or DC supplies. Frequency range starts at 26.00 Mhz and goes to 960 with no Mil Air or Cellular, and a few other gaps. The radio also seems to have a volume, squelch, and maybe even a channel selector knob on the top. Over all, it looks pretty good, and I am giving it some serious thought. If ACE has them at that price, it is the lowest that I have seen.

One more time......

It cost to much to even think about it! You have to be rich, board and totally fricken ignorant to do this. If I had a (extra) thousand dollars or two, I could think of a lot better things to spend it on.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

For whom is interested, I've sent to some of the usual sites a modfile
for narrowing the AM IF to 6Khz (or any other width) and dealing with a
filter leaking problem on the AR 3000(A) scanner. They are already
online on ftp://ftp.funet.fi/pub/ham/rigmods/AR3000-AM6khz.mod
and ftp://ftp.cs.buffalo.edu/pub/ham-radio/mods/ar3000.mod, and
probabily will be soon on some other site too.

Waiting for comments!

Do you know this guy or what? You sound like his mother. Next you'll
be criticizing spelling. Or maybe telling someone to clean off their
keyboard before typing. Do you chew your food at least 30 times to
make sure it digests better?

It appears that it is "YOU" that has not been around newsgroups very
long. It should be obvious to most that this kind of criticism would
only piss people off.

Agreed. The equipment needed to monitor a spread spectrum signal(s)
would be outrageously expensive and would serve to be basically
useless except for a few, very limited, situations.

It can be done if you are sadistic enough. Anything going over the
airwaves can be monitored. It's just a matter of how much money and
how much time you are willing to put into it.

> equipment to descramble this phone and nobody is that damn stupid!

Agreed. It would easier and more cost effective to tap the wireline to
your house and listen to ALL of your calls, not just the ones you place
on a cordless.

There is no cordless phone available to consumers that will prevent your
calls being eavesdropped on by someone with the desire and resources.
Your choices for secure wireline calls are very limited.

To address spread spectrum. It is secure against 99% of the
eavedropping threats you might encounter (people with scanners, other
cordless phones, etc).

Regards

The BCT-10 also has radar detection (I think, although it is really hard to tell from the Uniden home page).

I'm also curious as to whether the BCT-10's radar detection stuff is good or not?

I'm in California and would be interested in its capability to work with the CHP repeaters.

--GCT

I have the BCT-7. I wouldn't recommend it for any urban high density RF area. First, the scanner is a simple double conversion with lot's of intermod. Second, is that there are so many CA frequencies to be scanned, the probability is that you'll receive something (i.e. image or real). The result is that it's difficult to follow a simple conversation, because it takes so long to come around back to the first place you started...

I'd recommend a good handheld and a local frequency book...

>retentive freak! Do society a favor and go see a shrink.

No. It is actually considered GOOD internet citizenship to
politely post a little advice to help newbies set up their
software so that they can get the most benefit from their
use of the 'net.

If "Patriot" had his software configured properly, the
message COULD have been sent PRIVATELY, but that was not the
case.

What do you suppose we call YOUR kind of response?

>It appears that it is "YOU" that has not been around newsgroups very
>long. It should be obvious to most that this kind of criticism would
>only piss people off.

What is obvious to most is that people who fake their
address to something like "biteme@eatme.com" or whatever
yours says are not worth listening to about ANY topic. Grow
up.

3789. FS: Pro-51 (Toronto Area Only)

Source record: 217883

Pro-51 - 200 Channel Direct Entry Programmable Scanner (Handheld)

Features:

Band Search - scans frequencies for air, fire, weather and marine service without needing to know
the frequencies.

2-Second Scan Delay - delays the scanning mode 2 seconds before moving to the next channel

Memory Backup - keeps stored frequencies for 3 days during power loss

Priority Channel - checks your most important channel every 2 seconds

Ten Channel-Storage Banks - store 20 channels in ten different banks for easy storage

Monitor Memories - store up to ten channels during a frequency search to be transferred to
permanent memory

Hyperscan - scans at a rate of 100 steps per second

Frequencies:

29 - 54 MHZ (Ham, VHF low)
108 - 174 MHz (Ham, Aircraft, Fire)
406 - 512 MHz (VHF hi, government)
806 - 823.9375 MHz (public service, police, fire)
851 - 956 MHz (UHF hi)

Cell phone frequencies can be scanned by using a keyboard (NOT a hardware) modification.
Instructions are included.

This handheld scanner is in excellent condition. It includes all original accessories, box and
manual.

Original price - $399.99+tax
My price - $250

If interested, or want more information, please respond by E-mail to tcoles@tor.hookup.net

> be safe.

No, the minimum bend radius is dependant on the type of center conductor and the type of dielectric between the conductors in co-ax feedline. In this case minimum bend radius is listed by the mil spec as 6 inches.

The dielecric is real 9913 and 9913 clones if air and polypropylene strands. Better to go the hard line than 9913 if your transmitting. For scanners 9913 is OK. RG-8 does have about three times the loss as 9913.

3799. RELM Scanner with PL

Newsgroup: rec.radio.scanner
Date: 1996-11-12 00:00:00 UTC
From: gary.saffer@channel1.com
Message-ID: <40.44374.2433@channel1.com>
Source record: 217893

MA>Ace is apparently selling a RELM scanner (handheld with 200 channels
MA>and PL decoding). Price is $260. Never heard of the brand. Anyone
MA>have thoughts on this company or its products? Info on scanner is
MA>available at the Ace's web site. I'm sorry I can't seem to find the
MA>URL.

RELM is the company that was left after Regency sold their scanner division to Uniden. For several years all they concentrated on was two way radio. There may even have been a non competition clause that required them to stay out of the scanner market for several years. However, they are now back.

I saw a fact sheet on the radio the other day and it looks pretty good. Briefly, in addition to the 200 channels and PL, it features DPL, 10 priorities, with hierarchy, direct channel access, search, search hold, delay, 100 channel/second scan, LCD display, uses 4 AA batteries, AC or DC supplies. Frequency range starts at 26.00 Mhz and goes to 960 with no Mil Air or Cellular, and a few other gaps. The radio also seems to have a volume, squelch, and maybe even a channel selector knob on the top. Over all, it looks pretty good, and I am giving it some serious thought. If ACE has them at that price, it is the lowest that I have seen.

The first edition of 2026 did not have a back-up capacitor
they only have the 12v to keep memory.But since two
years (or a bit more)they have solved that problem.
There is a mod for thoses who have a 2026 without
back-up,you ahve to install a 9v batt.on the orange wire.
You can find that mod from Monitoring Times(I think I
have the copy of that one).

I would like to take a moment to tell you about the Michigan Public Safety Network (MPSN). We are a alpha-paging media source that notifies our customers instantly of working fires, Haz Mat incidents, serious vehicle accidents, medical chopper responses and major police incidents from both s/e Michigan and from around the US.
Our customers are media outlets, fire buffs, fire chiefs, firefighters, fire photographers, police officers, EMS workers and numerous other groups of people.
MPSN exchanges major incidents with many other paging groups from around the US. To cover the s/e Michigan area requires us to have many dedicated dispatchers working with us. We are currently looking to add to our dispatching staff. Although we do not compensate our dispatchers, we are able to provide some nice benefits. So if anyone reading this posting regularly monitors public safety radio traffic from s/e Michigan and would like to input these incidents into our paging system please contact us.

If you would like more info about becoming a MPSN dispatcher or member contact us at our E-mail address or at 313-454-6111.

Thank You,

Jon

Ahhh ... beg to differ strongly, Dave. I've still got 100 W VHF
(both low and hi band) and UHF Mitreks and they made (until a
few years ago) 100 Watt Syntors XX9000 (these are all Motorola
commercial radios).

I believe the other phones were referred to in the movie as "GSN" or "GSM" rather than cellular phones. I have seen one of those terms in the NG, but did not bother to read the associated messages. Could they possibily be referring to Global Satallite as opposed to cellular networks, assuming that's what GSN stands for? Ofcourse likelyhood of a phone that size being able to reach a satallite from inside a 747 is probably remote, but a writer's embelishments do not necessarily have to be limited by this.

3813. BC120XLT vs SC150B

Newsgroup: rec.radio.scanner
Date: 1996-11-13 00:00:00 UTC
From: Hilton Goldstein <hilton@sgi.com>
Message-ID: <328A8BF4.3B54@sgi.com>
Source record: 217680

Hi,

Anyone have any comments about these? I wish this was easier, but I'm chosing between these two and the Pro-62/3 models.

I've almost narrowed it down to the BC120XLT and SC150B, but any good arguments may swing my vote.

I'd *really* appreciate hearing from anyone who has used any of these three models. BTW: I know very little about scanners except what I've seen in thee newsgroup lately (and the FAQ - thanks Bob!). I really need it to listen to aircraft; i.e. 118-137, but obviously other ranges may be useful too.

Thanks,

Hilton

3815. Pro-2026 constant power (or not)

Newsgroup: rec.radio.scanner
Date: 1996-11-13 00:00:00 UTC
From: Sam Iraci <iraci@epix.net>
Message-ID: <328AC306.2D4D@epix.net>
Source record: 217682

A brief recap:

... radio shack pro2026 ...
... you have to keep constant power to keep the memories ...
... have since unplugged the power source from the back of the unit
at least a dozen times and have not yet lost a programmed/stored frequency ...
... Would like to know how you unplugged the power source from the back ...

There are (at least) two versions of the 2026:

The Realistic Patrolman PRO-2026 (20-148) has a permanently attached three-conductor power cord, which includes a constant power lead. Mine holds the memories for about 10 minutes when completely disconnected.

The Radio Shack PRO-2026 (20-148A) has a detachable power cord with no constant power lead, and an internal capacitor to hold the memories when disconnected. Mine has held for a week (but mysteriously clears all the memories from time to time...) This one also has a little folding stand for desktop use.

Although the newer version came out around the time of the Great No-Cellular Edict, the magic jumper L201 appears in both versions, and seems to have the same effect.

The reason your "scanner" is so restrictive is because its a Handi-talkie amataeur radio and not a scanner at all. If you don't have a ham license, which I'll asssume you don't, you shouldn't even be possesion of such a radio.

I am interested in buying a preferably new or used handheld scanner that goes as far down on the spectrum as possible (100khz if possible) up to 1300mhz (more if possible).

I want it to have no blocked areas at all, completely 100% continuous, including cellular.

Can someone please recommend a brand and model and where to get it?

Thanks,

Most if not all of the error in the data comes directly from the FCC! We had seen this before when we used to get the data on 9 track open reel tapes.

I have never seen or heard of a land mobile radio system where the signal wasn't demodulated all the way down to baseband audio before retransmission. The scheme you describe is common for microwave repeaters.

A good squelch circuit can be fast enough that the noise burst can be completely eliminiated. The use of PL or DPL will also eliminate the noise burst.

It *is* illegal (in the U.S.) to listen to cell calls.
The ECPA has been modified to make it so.
Cordless phones, too.

Nope you are wrong.....
1) It IS ILLEGAL to monitor cellular phone conversations
2) it is illegal for manufacturers to produce cellular capable
scanners for the us public at large (they will not get FCC approval)
making it illegal for stores to sell them
3)It is not illegal to own a cell capable scanner (since they were
produced andd FCC approved for quite some time)
4) it is not illegal to sell a used scanner which has cellular
capability.

In this light the origional poster is correct:
>>>It is NOT a good idea (rather very foolish) to show people that you
>can/are listening to cellular telephone calls.<<
since this is admitting to violation of federal law!

For VERY close range you can try 155.46. They also use that when using
airplane spotters.
Just be aware that by the time you can hear them on this freq, they
can probably see you.

Subject: speech inversion scrambling

does anybody have any info on decoding this 'inversion-type'
scrambling..??

The area detective channels are using this method... anyway, I was told
that's what it was..??.... kinda sounds like those TV interviews, where
they try to disguise the person's voice... exept worse, of course.

any info is appreciated....

Rob.

HEY!! HEY!!! That will take away some of our most interesting scanner listening! Besides, Most people don't have a clue. I know some lady who was told time and time again that people could listen to her baby monitor with a scanner. She whole heartedly refused the idea stating that she had the receiver part so how could anybody else listen? DUHHH!!!

So what are these GMRS licenses anyway? Do you just send in a request for the
license? Do you have to take a test? Is it essentially a ham VHF ticket
without a test? How much is it for a license?
TIA

What is it exactly that bothers you about bad spelling? Dig deep now. It's got to
be some quirky personality trait that allows it to get to you. Most people read

any message, understand it then go on.

You say "go ahead and let the whole world know how stupid and ignorant you are by bad spelling? No no. What bothers "you" about it? Whats the real problem you have? Writing is communication. If a message is communicated then quit obsessing about the details. Do you go berserk when you go to someone's home and see pictures out of alignment? Do you hate it when people wear different colored socks?

With so many legitimate things to worry about in this world it baffles me why people become so obsessed with spelling of the english language. What a boring existence it must be for them.

Chad

> terminals?? If not, does anyone know what format they are using?

As far as I'm aware, POCSAG is strictly a receive only paging format. It is designed to accomodate short
numeric or alphanumeric messages to be sent to any one of a large base of users. The police mobile terminals
however, can often receive several screens full of data and transmit as well. Therefore, it most likely uses
another type of transmission protocol. Possibly based on packet radio transmission techniques? There were a
few messages on this subject awhile back either in this NG or in alt.radio.scanner. You might try looking back
at old messages if your news server still has them.

Got it, tried it, it didn't decode anything on my scanner through the headphone jack. The old 16-bit version
actually worked better on my system.

> will appreciate any help I can get!

I also started out with the Pro-51 and went through the same antenna cycle. The stock antenna is pretty worthless, especially while the scanner is laying flat. In the house I use the 5 segment loaded telescoping antenna from Radio Shack (about $10 and well worth it.) I'd put an antenna in the roof, but I move around too much and take the scanner with me from room to room.

In the car I started out with the stock antenna. It works OK for base and close mobile transmissions if you can put it in the car in such a way that the antenna is vertical.

I tried the glass mount also. It worked a lot better than the stock antenna for everything except VHF low.

I eventually broke down and got one of the magnetic mount scanner antennas from Radio Shack (the one with the two load coils) and stuck it on my car. To hell with being inconspicuous, I want better reception. It works great! It absolutely blows away any other configuration I've tried.

The mag mount does so much better than even the telescoping antenna that I got another one and stuck it on a filing cabinet as close to my office window as I can get it.

The mag mount is the way to go for best reception. The glass mount is next best, and the duck is the worst. It depends on your balance of asthetics/utility.

Even with the mag mount, though, you'll have the same intermod problems with the Pro-51 if you get too close to a paging tower or someone fires up a cell phone too close to you. For most of my commute I have to lock out the 800MHz frequencies. It got so annoying I put them all in one bank so I can turn them on and off more easily.

I solved that problem though - I just got a BC300XLT which blocks out all but the most tenacious pager towers and moves the cell images out of the 800 and 900 MHz bands.

On October 17th I sent a package from NJ to Boston COD for $355.00.
The package was received and the COD was paid for in cash on October
21st!

I STILL haven't received my COD from the United Parcel Dis-Service.

On 11/4 I had to initiate a tarce, which is a nice way of saying that
they'll look to see who pockedted the cash.

They're records show the cash collected, and thats it..no check was
ever issued to me.

This is unacceptable service from a shipper the size of UPS, or from
any shipper for that matter, FEDEX shoots your money back the NEXT
DAY after shipping. Yes, they charge a little more, but you pay for
what you get I guess.

Just a warning to all here who sell items in this fashion.....

: any modifications needed to the radio? Also, is the Scout worth the money
: in the first place?

You don't need to mod the radio, but it's recommended you replace the 6-pin
flat connector with a couple of sub-miniature phone jacks. This is a
much more durable and reliable interconnect between the Scout and 8K.

I personally have never used a Scout, but most of the posts I've seen say
it's a good thing. The only drawback is that it tends to lock on to
unwanted signals such as FM broadcast towers and pager towers. Filters
on the antenna input of the Scout can be added to correct this.

Source record: 217746

For Sale:
1 pro-43, good condition, with cell mod performed.
No original manual, but will send a photocopy.
All accessories included. There is a slight scratch on top
right corner. Otherwise in very good condition. I do not
have the original box.
$ 195.00 includes shipping within the States.

Another pro-43 for sale. Cell mod has NOT been performed.
Radio is in excellent condition. Looks just like new.
I will send it in original box with manual and other
accessories.
$ 200.00 includes shipping costs.

FS: BC 3000 XLT
Just like brand new. Never used outdoors. Less then total
of 15 hours of use. This is one of the top of the line models.
Sacrifice at $ 300.00 including shipping costs.

Please note:

I will ship out these units ONLY once I receive a check or
money order. I will not accept COD's. It takes too long and
I have not had a good experience in the past using this method.

Please reply directly to me.
Thank you

David

Hi, , , , ,
Even though I am an Engineer and Electronic Technician, (retired)
I bought the Optoscan 456 with some trepidation. I didn't want to
screw up a 300 dollar investment in my 2006. I read the
instructions about ten times before I got up nerve enough to
start. When it came down to it, the mod was very simple and it was
documented adequately and the parts all fit. It took me about
three hours, and worked the first time I turned it on. I strongly
recommend it. I use Scan*star, which is adequate but not optimum
(IMHO).

I have heard from several on this newsgroup that the Dimond RH707 is the
best replacement. I have not tried this however.

Read the Privacy Act of 1986 and you will find that it is illegal to
listen to cellular and Cordless Telephone calls! So the simple scanner
rule might save you a hefty fine! If you do listen, don't tell anyone
what you heard, where you heard it, or what you heard it on!

The ARRL handbook will show you how to make a balum out of RG58-coax.

As for transmitting on 2 & 70-Cm- well it would work, but not very well. Scanner antennas sacrifice gain and low-SWR to get wide frequency coverage so a antenna designed for a certain band will always work much better.

:>trying to receive 900 MHz cordless phones,in the 902 - 905 MHz range,
:>simply try searching 923.6 - 926.6 (902-905 + 21.6 MHz) instead.

:Why the "magic" offset 21.6 MHz? Is this value the same for all scanners?

All scanners convert the received frequency to some fixed frequency to do
the filtering. In the lower end scanners that is likely to be 10.7 Mhz hence
the offset to the image signal will be twice that at 21.4 Mhz.

Dave,

I have the ar8000 and Scout. Make sure you get a late version of the scout, 3.1 or newer as they interface directly with the SAC8000 cable to the ar8000. Earlier versions use the CBAR cable adapter which requires installation of a 3 conductor 3.5mm jack in the ar8000.

The Scout is a near field device so keep that in mind when you get disappointed with it not picking up cordless phones. If I take mine for a drive I usually pick up cell phone transmitting freq (825 to 839), public service repeater input freqs (154 range) and some FM broadcast stations. I need to add the N100 filter to reject the FM broadcast stuff. The key is to use antennas on the Scout that are designed for the frequency range you want to survey. THat way the antenna provides a measure of rejection to other frequencies.

I just bought a new Scout and plan to sell my Version 3.0 with the CBAR cable adapter for $300 if you are interested. It is a handy little tool. I can sit in the parking lot of the lock and dam on the Ohio river and catch the tug boats locking through.

This isn't really on-topic, but I'm hearing that Canadians
have to pay hefty fees to get UPS and FedEx packages out of
their Customs offices. Regular mail is delivered after
Customs clearance without extra charges.

I have a "Friend" who "doesn't listen" to "cell phone calls", and he has a question.
There are about 1000 frequencies in the 800mhz range. How are calls handled when there are more that 1000 calls being made?

Also, how large are the cells themselves. Several miles?

Is a call broadcast througout the country? How does it find "his" phone?

I've had a exp9100 for a few years. I guess it's pretty secure.
It's digital spread spectrum. I placed my frequency counter right
on top of it and it can't seem to lock on a anything.

You missed the sarcasm... If you are prone to experiment in the
reception of SS, then you only need another SS phone (and possibly
a lot of trial and error in matching the sequence).

I'm curious what other have to say, too. I've heard some bad news about the '9000, especially concerning sensitivity and selectivity. The specs looked better than the 890, however. My 890 worked okay for 29-225 MHz and 800+, but *required* a roof antenna for 225-477.

<horribly misspelled remaining text deleted>

I for one do not believe Don is ignorant or stupid, but at the same time I
am not sure I am conviced he is dyxlexic either (god, I hope I spelled it
right or I'M the stupid one).

Point is:

A person who has trouble walking gets a cane.
A blind person gets a seeing eye dog.
A hard-of-hearing person gets a hearing aid.

- thus -

A person who has big trouble spelling runs their text through a spell
checker.

With text processing technology today there is no reason you cannot produce
a relatively cleanly spelled document, regardless of your language handicap.

I am convinsed of this fakkt.

Mike

According to Aviation Week & Space Technology (great publication) Nov 4
1996 issue, President Clinton Appropriated $38 million for the SR-71. A
US Air Force Sr-71 made it's reactivation flight Oct. 29th. The Air
Force pilots are being bruoght back up to speed by NASA pilots.

Lockheed is installing new data link equipment and bringing the
aircraft to mission ready status. Evidently real time intelligence has
a need after all.
Will be great to see the "Blackbird" in action again.

3890. FS: OptoElectronics APS-104 Active Preselector

ForSale:

OptoElectronics APS-104 Active Pre-Selector
-Tunable band pass filter system
-10MHz to 1GHz
-Continously tunes over more than 5 octaves
-Maintains a constant 4MHz bandwidth over entire range
-Electronically tunes
-Ultimate Security Sweeper
-Extend Near Field detection distance 10x
-Includes Internal Rechargable battery pack and charger

New this is $900 from Opto, I am asking $550 or best offer

The unit is in perfect conditon, and has seen very little use.

The perfect use for this is in conjunction with the Scout or Explorer, it provides a very significant boost in capture range.

I was using it with the Scout/AOR-8000 combo and it worked great.

I purchased this for a project and no longer need it.

3891. antenna question (reception while mobile)

I never could figure out the "beehive" logo, either. What's the connection? One usually doesn't associate Utah as being the "honey capital" of the country.

As for lights or no lights (exterior, anyway), my understanding is this, at least what I recall reading about somewhere:

I read somewhere a while back why CHP units in some areas have exterior lights and why others don't. Has something to do with wanting increased visibilty or "presence" in some places and use of the "element of surprise" or "blending in" in others. Something like Rural versus Metro areas. But I can't remember which was the case where.

>TYler

I have to say MEGA DITTOS to everything Tyler said.

I had to make three trips between two Rat Shack stores to find a BRAND
NEW Pro-62 with instruction manual, etc.....

Of the FIVE boxes we went through, All were re-packs, except for one.

One Por-62 looked like it had been used for years, and was re-packed in the box with the Manager having the nerve to tell me it was factory fresh.

ALWAYS open the box at the RAT SHACK......

Re-packs are the RULE, not the EXCEPTION...

Don't laugh too loud. According to a strict reading of the law (by judges, not by us more sensible hobbyists) it is technically illegal in New York State to carry a scanner in your car at all. One court has ruled that a scanner is still "capable of receiving signals..." if it is unplugged and turned off.

The actual case cite is on my website - http://www.frontiernet.net/~dstark/laws_ny.html

We here at the Wacko Free Wilderness Society are submitting the first draft of our charter.

What we are about. We simply want the freedom to go out to the woods, camp, fish, hike, and do whatever else we want to do in the wilderness without running into environmentalist wackos.

We at WFWS are committed to a world, one day, where our children can cut down trees when and where they want, provided they own the land. We want a wilderness where you can use a cellular phone without having an environmentalist jump out from the bushes, stomp on your phone, and throw pigs blood on you, all the while repeatdly screaming "Murderer!" A wilderness where you can walk through the trees without running into a sign clad wacko chained to a tree singing "We Shall Overcome".

We have taken no action as of yet, and are not soliciting members at this time. We do not condone illegal activities such as sniping wackos. We have taken no legal action, but may be forced to some day.

If you have any more suggestions for the charter, please feel free to write.

If you are going to get inside the scanner you might consider replacing the
connector with a REAL BNC. Any scanner I have seen uses a cheap 'looks like a
BNC'. A real BNC is quite rugged, but you can't get them at Radio Shack.

No matter what aerial I tried all I got was a lot of static, and
turning the squelch up and down didn't make any difference at all.
I was a bit reluctant to try another scanner on the aerial in case the
same thing happened again, however a lot of people have told me that
the aerial shouldn't have caused me any problems (bar static buildup)
so I shall be trying again now that I have got another scanner (under
warranty).

What you said about grounding the aerial connection before plugging it
in is interesting, though do you ground the inside/outside or both
connections????

Thanks to everyone who has helped me with this.

Grove Enterprises' web page has the ARTCC frequencies. The FSS's
pretty much all use the same frequencies, 122.2 and 255.4 being the
most common, I believe.

Grove's url is: http://www.grove.net

I have a 1989 vintage BC 800. Any mods or advice/comments on this model would be appreciated. Is it possible to expand the standard frequency ranges of 29-54MHz, 118-174MHz, 406-512MHz, and 806-947MHz.?
Thanks,

Squelch tail or transmitter delay, to provent constant re-keying.

Also some
> go 'beep....beep....beep for a while as well.

> Does it depend on the radio used?

Sometime. Motorola, for example, uses a format called "reverse burst".
When
the mic is un-keyed the transmitter continues for another few hundred
milliseconds
sending a the PL tone 180 degrees out of phase which immediately stops
the decoding.
GE did it different by not sending any tone for the few hundred
milliseconds. Both systems
had the same effect.

This caused the PL type squelch to immediately turn off & eliminate the
squelch tail.

You still won't break it. Were talking about digital stuff here and to beat it all its spread over a 5 mhz spectrum. I just don't think its possible now for the average scanner nut to do this....now if you are a rich this might be a different story....it will be 10 years before anyone breaks this stuff and 5 more after that before you will see it on the market. By then there will be another kind of encription.

Some of the new Spread spectrum uses frequency hopping....impossible to break by regular citizens....maybe Uncle Sam???

There will have to be a computer involved in breaking the Spread spectrum phones.

Hi Dan,

Sorry to hear about the foul up by UPS, but adding insult to the injury? How sad their service truly is. I had my run in years back and warned people about their (dis)service.

After a month went by w/o a pkg being delivered, I called and asked of the status of the pkg. I had to call them several times that week and they kept saying they found the pkg and would deliver it.

Eventually I got tired of the run around and called demanding they deliver the pkg. The individual who I spoke to actually asked me why I needed the pkg so badly?

Gee, I only paid for it, and had waited a month now for them to deliver a "service manual" from RadioShack. I since told RS to "mail" everything USPS, it now only takes 3 days, not 30! And costs a lot less.

UPS = Utterly Pathetic Service

They owe you a huge apology and some money.

Regards,
LGS

Message-ID: <56fs05$7d5@fn3.freenet.tlh.fl.us>
Source record: 217537

I have been thinking about something for some time but have not had
the time to play with it. Maybe someone else will have the time to mess
with it and we can all benefit.

When one enters a frequency from the keypad of a scanner this information
is stored in a register. When the program key is pressed the firmware in the
scanner checks to see if it is an allowable (not blocked) frequency and then
writes it into the memory location the user has selected. It is reasonable
to assume that the address and data busses have the desired information on
them and are waiting for a WRITE DATA pulse to store the frequency in memory.
It is also reasonable to assume that if a blocked frequency is entered the
firmware beeps at you and does not pulse the WRITE DATA line. If the write
data line is accessible and is wired to a button for instance the firmware
for blocking frequencies can be bypassed and any frequency can be entered.

The most likely stumbling block is that the memory and processor are on the
same chip and the WRITE DATA line is not accessible.

Anyway it shouldn't be enormously difficult to get info into a static ram location
if it is separate from the processor. I have a PRO-60 but I don't have a schematic
for it. My pro2006 has memory external from the processor but it is older and
larger (and the above point is moot).

If anyone has schematics for whatever radio they own look and let me know what
you see.

Bruce

m>As for lights or no lights (exterior, anyway), my understanding is
m>this, at least what I recall reading about somewhere:

m>I read somewhere a while back why CHP units in some areas have
m>exterior lights and why others don't. Has something to do with
m>wanting increased visibilty or "presence" in some places and use of
m>the "element of surprise" or "blending in" in others. Something like
m>Rural versus Metro areas. But I can't remember which was the case
m>where.

At one time CHP cars only had light bars in the metro areas. Cars in more rural areas had a red spot light on front, and red and amber deck lights to the rear. However, about two years ago the Commissioner decided that all cars will have full light bars. I think the only ones left that don't are older cars that are going to be retired and it's not worth the money or labor to do the retrofit.

Mabye someone can answer this for me. Why is it that some CHP cars are all white, and the officers assigned to them seem to have blue BDU uniforms? From watching TV, it seems that they might be Canine units, but I am not sure.

I just read the same article........

You must have a creative immagination (or own a Cobra CP-912).

They all performed equally, with the exception of a few feet on
distance - 2 city blocks and 4 stories up is MORE than adequate.

If anything, the Uniden was superior because of its extra features and
automatic frequency shifting.

> BTW, intercepting cell phone transmissions, regardless of whether you
> are using a "blocked" scanner, is illegal ;) Scott.

Scott,

Your are receiving an image frequency of the cellular frequency on the
scanner. Most handheld scanners and other inexepensive scanners have
very poor image frequency rejection in the 800-900 MHz range.
They are this way because they are usually single conversion at that
frequency.

I have verified this with my handheld Pro-46 vs. my Pro 2006. The 2006
does not create an image.

To verify this use this calculation Fimage = Freal + 2*Fif.

Where Fimage is the frequency your scanner is tuned too.
Freal is the actual frequency that the cellular conversation is taking
place on.

Fif is the intermediate frequency of the scanner, 10.7Mhz on a Pro 46.
If a conversation is on 890MHz then with a poor scanner you could pick
it up on 890 + 2*10.7 = 911.40.

There is a silver lining in this all, that is if you wanted cellular
coverage but the scanner is not convertible, then you can still pick up
a good portion of the celluar band.

Hope this is usefull.

Hard to believe but the safest by far is the United States Postal
Service. The sheer number of packages they handle makes it unlikely you
won't get yours. Another interesting thing is that UPS, FedEX, DHL, etc.
can open your package anytime they want and they don't even have to tell you.
USPS on the other hand requires a search warrant. While doing Drug ops we
got a lot of folks shipping drugs via post services. If UPS, FedEX, etc.
was the shipper it was cake to search it. To get USPS to open it was a
real pain in the ass and rarely happened. Thieves love UPS as well.
There are some neighborhoods they won't even deliver to but they still
leave packages outside. Pretty stupid. Now, I know none of us here are
smuggling drugs but the fact is, the private carriers CAN open you stuff
and loot it all. Then they can seal it all up and when you complain, they
won't give a rats ass. UPS *lost* 5 of our Pentiums we ordered from
Gateway. They took forever to even investigate it. It took months to get
the money for the computers. Whats even weirder is that they simply
disappeared in Chicago.

: In principle you are quite correct, NTSC recorded tapes cannot be used
: in PAL VCRs.

: BUT, many modern PAL system VCRs have a possibility to play (but not
: record) NTSC recorded tapes.

: If viewing NTSC tapes is important enough to the original poster,
: he might consider getting a new VCR that will play NTSC tapes.

: Regards
: Peter

Another point. You will probably need some type of multi standard
television as well. NTSC uses a different refresh rate and a
different number of lines. A TV that only works with PAL will
not be able to handle this. It is possable to convert NTSC to
PAL, but the picture quality is not good even if you spend
a small fortune on the equipment.

That's why many American programs suffer poor picture quality
when showed in the UK. These are the ones that had to be
converted from NTSC.

Richard.

RAG> I'm curious why you say it's crap--what have you found wrong with it?

It's a very poor design, they left out scanner performance to add 'tricks'. Extenders are seldom in use when you NEED to know about them, and a built-together scanner/radar dectector would HAVE to cost more, and be larger, than the BC model, in order to equal the performance of even mid-level separate units.

... Better to be judged by twelve than carried by six...

Hi guys...

Could someone possibly e-mail me a copy of the new Semasoft 32-bit
POCSAC decoder? (uuencoded or attached)

Thanks in advance...

Sorry, Mike. You have no legal recourse. He made a "good faith"
effort to fulfill his end of the bargain. Not to mention that oral
agreements don't carry much weight. Take your lumps, and maybe deal
with someone you trust in the future.

Mark

The truth as I perceive it to be.
Your perception will be different.

In Chattanooga, they rarely discuss it beforehand on the two-ways, and when they do, they'll use the digital encryption on the radios. A lot of times, especially afterwards, they switch off encryption, since it tends to limit the range and ability to access the repeater (that's right, they use a repeater!)...

I'm hoping someone out there in netland will be able to advise me on my current dilemma that is really killing me. I met a guy Charlie at work, who sold me an RS 2004 for about 300 dollars, I know, it's a lil high for a 2004, but I figured it wasn't too much since I would have to wait longer to get one on the net. So, at first it was going good for a week, when the scanners display kept shorting out, if it picked up a certain signal or something the display would go blank and I would have to reset. I was concerned that this 2004 would break, and I would be out 300 dollars, so I talk to him, and he agreed that he would get me a loaner, until he can get me a scanner of just about the same price as I paid. He gave me temporarily, a crappy little mobile scanner, which I was not happy with and I repeatedly reminded him. Several months passed, go figure, this happened in May/June, and now It's Novemeber, he calls me, says he has a scanner, but I need to cough up another 70 bucks, I was willing to do to get this whole mess outta the way. it's an RS3004, but now after using it, I feel like I'm getting reamed, and I'm fed up. Do I have any rights? I'm thinking perhaps a small claims court case could solve it, I know a little about torts, and I feel he broke an oral contract, but I don't want to get in over my head. I guess I could of prevented all this, but I'm such a smuck, I was too trusting, and shouldn't of put the whole sum up front. I guess I don't want to just give up and let myself be walked over. Please, any help is greatly appreciated!

Thanks in Advance!

Mike

P.S. If it's at all possible, reply to me via email! THanx!

* What is GMRS?

[This applies only to the USA.]
The General Mobile Radio Service is another personal radio band. Its frequency

allocation is in the ultra-high frequency (UHF) spectrum, co-located with some other radio services in the range from 460-470 MHz. It requires a license but there is no examination. Though GMRS is not CB, it is listed here because it is intended for use by individuals. A single GMRS license also covers the members of the licensee's household. The license fee is US$35 for 5 years.

frequencies (MHz) modulation description
460 - 470 FM General Mobile Radio Service (GMRS)
regular channels (simplex or repeater
outputs, repeater inputs are 5MHz higher)
462.550 462.575 462.600 462.625
462.650 462.675 462.700 462.725
simplex low-power channels
462.5625 462.5875 462.6125 462.6375
462.6625 462.6875 462.7125
31.0-31.3 GHz any mode microwave band now open for individuals
to use, requires GMRS license

GMRS is used for mobile-to-mobile or base-to-mobile communications but base-to-base communications are prohibited. One useful aspect of GMRS is that repeaters are allowed so that a mobile GMRS station can extend its range well beyond the limits of an ordinary 5-watt mobile transmitter.

Only individuals may obtain GMRS licenses. Some businesses still have licenses from before the rules were changed in 1989 but no new licenses are being issued to "non-individuals."

For more information, you can obtain compressed text files via anonymous FTP at ftp.amdahl.com in the /pub/radio/other directory in the files called gmrs.intro.Z and gmrs.microwave.Z. If you don't have access to the Internet or need help with FTP, see the rec.radio.amateur.misc FAQ, Part 3.

Another source of information is the Personal Radio Steering Group. A reader said they have lots of good information and are enthusiastic about GMRS.

Barry
Amtrak uses the radio frequency for the railroad that owns the track
it runs on, exception--major terminals ect---for its' daily operation
to find these railroads out just look at the amtrak timetable
as it lists the cities there will be a header every so often
with names like "CSX Conrail ect" then using a frequency directory
you can find these frequencies.

Secondly while on the train look at the portable radios that some of the
crews will be wearing
when I rode they had ones that had a display that read eg.(" "9898")
I later realised that the "98's" denoted the AAR radio numbers
check it out

>
>The 800 band seems pretty split up (looking at the manual). Is there any way
>to restore continuous 800 band to this radio?
>
>Thanks much.

Jeff,

First of all, congradulations! You made the right choice by not asking the Radio Shack sales droids what they think and going to the news groups. From what I hear, the PRO-62 is the replacement for the PRO43 which is setting here beside me. The PRO-43 is a VERY good scanner but they don't make it anymore. Also, it's been said the PRO-62 is a very good scanner, BUT it has no cellular coverage. THis is why the 800 mhz band is split up like it is. If you want to listen to cellular calls, I suggest you look for a used PRO-43 on the newsgroup somewhere. I've seen them here for around $200. If you have no desire to listen to cellular phone calls, then get a new radio with warranty from Rat Shack. One word about buying from Radio Shack:

KEEP THE BOX, RECEIPT, PACKAGING, EVERYTHING. If something goes wrong, take it back. It's much easier to take it back if you have everything.
Which leads me to my second point about Rat Shack:

Since the boxes are easily put back together, it is VERY possible that you have just bought a brand new PRO-62 that has been at someones house for a few weeks till he dropped it or something went wrong and he brought it back. It has and does happen at Rat Shack. BEFORE YOU LEAVE THE STORE, open the box and look at everything in it to see if it looks like it has been used before. (scratches, dents, paint chips, wires jambed back in the box not the way they are supposed to be...ect.) RaT Shack is known for taking a product that has been returned and placing it right back on the shelf for the next sucker.
Sorry for the griping. It's just my 2 cents...YOU HAVE BEEN WARNED!
Hope this helps...
TYler

Oh yea, if you are going to get a used PRO-43 to listen to cellular calls, you need to find one that is capable of being modified or has been modified. If you find one that can be modified but has not been and need it done, I'll do it for you. Heck, for $20 I'll even send you a photocopy of everything I have on the PRO-43 which includes a service manual and half a dozen mods for it.

Tyler

(that $20 would go for shipping and photocopying of course)(just to satisify Cheek who I got the mods from although I don't know why I should credit him if they are public knowledge)

> Signal strength graph? Spectrum analysis?

Indeed...all add up to make the AR8000 a pretty powerful machine....and
features with neither the MVT-7100, MVT-7200 has (indeed to a great degree
features that the new MVT-9000 doesn't have either) and to many the RS232
and Scout could possibly make or break.

> It seems to me that the AR8000 outperforms the 7100 in these areas (and
> probably more) so I'm wondering what redeeming features it has that make it
> better than the AR8000?

Audio & RF performance.
Invariably you will find that current or past owners of both the Yupiteru
MVT-7100 & the AR8000 will say the MVT is the better receiver and
outperformed by none (with such coverage) whilst acknowledging that the
AR8000 certainly wins the features stakes. If RS232 and Scout control
is not a "critical" feature then the performance and audio of the MVT-7100
might just be something that could swing the day.

Both excellent radios at the end of the day though.

There are several reasons why I now use FED-EX for all my shipping and

COD transactions.
1) they are more reliable- On Time or before! UPS never seems to take
the time they claim it does, always longer!
2) they dont just drop packages at the door - I've had numerous times
that Items were left at the front door even though I was home and a
signature was required. Not a good Idea since we've also had Items
that were left at the wrong address even though signatures were
required.
3) Quick return of MY MONEY. Ups can take up to 30 days to get your
check. While FED-EX will deliver it to you within days. I've actually
had occasions where the package was shipped saturday, delivered monday
and I had my money tuesday AND THAT WAS A COAST TO COAST OPERATION!

I think UPS should advertise, When you really don't care if it gets
there or not!

3956. Re: Radio Free Wilderness

Newsgroup: rec.radio.scanner

Hi everybody!

Sorry for this ironical posting, but I can't believe
what some people think is best for all other people...

--Irony switched on--

This is the announcement of the foundation of the
Clothes Free Wilderness Society

Data, Statistics and Fact Sheet #102.43 B

1. We recongnized that in recent years an increasing
number of people is making a hash of their wilderness experiences.

2. This is because they do wear clothes! None of our predecessors
ever wore a GoreTex rain suit or even a hiking boot.

7. They spoil their intensive experience of the pure wilderness.

c. Have you ever felt pine needles under the soles of your feet?

4. Have you ever caught a cold because you got absolutely damp and
wet? No? Whimp - get out of wilderness! It's only for the toughest
of us!

We declare that all people wearing a piece of clothes other than
a pelt of a bear that was personally killed by hands are whimps -
spoiling our and their wilderness in an unforgivable way!

It is our goal to keep wilderness as clean as it once was - when
apes and men fought for the same trees!

--Irony switched off--

Sorry, but ban cell phones from wilderness? Why then not ban clothes
from wilderness?

I think that in 'real wilderness' a cell phone is
useless because you won't have a net available (a VHF
radio device, of course, makes a difference...) - but that is not
my problem. Who ever wants to carry cell phones - be it so!

If people worry about others having cell phones with them they could also begin
to worry about other - much more important - things...
And I - and I am sure allmost everybody else too - want to
decide for myself what is best for me and what I take along with me on a hike.

Best regards,
Holger Scholl.

It would probably still be best to avoid doing that unless absolutely necessary. You don't have to be
paranoid, but some precautions are simple and easy to take.

When word of off-the-air ESN grabbers first began circulating in the news media, the general concensus was
also that the complexity and cost of equipment involved would be prohibitive enough serve as a deterrent for
most criminals. Then some dedicated indivudals discovered simple and effective methods of obtaining and
altering this information using inexpensive equipment or even through another cell phone. First and second
generation electronic products, such as your SS phone, are not always as foolproof as you are led believe.

>what you get I guess.

If I may add my .02 cents worth:

I just purchased a scanner from a guy in Maryland. (I live in Idaho),
He shiiped it to me COD, via USPS, on Friday afternoon, and it was
delivered to my the following Monday morning. Anticipating the arrival
of the package, I already had a USPS money order ready and waiting to
pay for this COD delivery. The Post Office forwarded my money order to
the seller, who recieved it that Friday.

I did not expect to even receive the packagwe within seven days, but I
got it in three! and he had his payment within seven days of shipping
me the COD package, and it cost less than UPS.

I do not work for the Post Office, but I was so impressed that I had
to call my local station and thank them for their expediant service.
They told me that that kind of service for COD packages is common
because it is handled as a "Registered" or "Insured" package, and as
such warrants special handeling to maintain security, and so therefore
generally travels faster than even First Class mail. Interesting!

I was also told that when buying anything over the net, it is better
to use the USPS for shipping and for payment through USPS money
orders: The reasoning behind this is that if someone sells you a bill
of goods, but fails to deliver what they promised, after accepting
your U.S.P.S. money order in payment, can then easily be charged with
mail fraud....

Just a thought (or 2....)

They were not cellular phones. They were called "Iridium phones" or "satellite phones" in the movie. The current satellite phones I've seen are briefcase sized, and need to be quite powerful to reach geosynchronous sattelites. The Iridium system in not operational yet, but will use sattelites in a low polar orbit, so the phones can be less powerful, and much smaller (possibly even small handhelds as shown in the movie).

At least they researched enough to come up with the best explaination for the phones they wanted to use in the movie! The fact that it doesn't quite exist yet is just a minor detail to the movie makers!

> output for the Pro43 and Pro2006?

Look at the schematic supplied with the 2006. Be careful though to
isolate the descriminator from whateveritis you're going to connect to.
The IC is extermely sensitive to static as well as the usual precautions
against heavily loading the circuit.

A simpler approach is to take the hot side of the squelch pot.

Hey Guys
These reasons are why I started using the U.S. Postal service. And I get about the same service for less money. UPS used to be the way but not any more. I got a package from the Veterans Services in Washington DC and had a lot of paperwork in side, but it was so wet form water and stuck together that I had to through it away. When I called UPS about it they had a attude like SO. Then told me to call the VA and ask them to send it agin and they wouldn't charge them for it. YEA RIGHT. So I call the VA and they sent it with next day US MAIL and it was DRY.
So in short why not try the oldest system, US MAIL. By the way I don't work for them.....DAVE

3972. Re: Is $230 too much for a Uniden BCT7??

Newsgroup: rec.radio.scanner

From: Rich Wells <rjwells@vnet.ibm.com>
Message-ID: <328B56B0.2781@vnet.ibm.com>
Source record: 217601

I've seen BCT-7 recently advertised mail order for around $140. Add
$9 - $15 shipping and you'll be well below the $230 rip-off price.

It's a nice unit but like most "true" mobile units, it is only
double-conversion so forget useful VHF work in large-city locales.

It does have nice, loud, crisp audio and nice back-light LCD. Low
VHF reception(40MHz) is very good, UHF is good and 800MHz is decent.

Strong signals,
Rich Wells

>areas. But I can't remember which was the case where.

Interestingly enough, there is a law in Idaho prohibiting "undercover"
State Patrol cars. The story I heard on a local newscast stated that
ISP had tried to get permission to once again put covert cars out on
the highways, but the legislature turned them down! Unofficial word is
that som lawmaker got nabbed for speeding by an undercover ISP
officer, proposed the legislation, and since then there are no
un-marked ISP cars....

Apparently, this only applies to ISP Patrol Vehicles, as local and
county cars are still unmarked....

3976. Re: Cordless Phone Eavesdropping Generates Suit

Here is a good article that was published a few years ago. I don't do it
any more but you could do like I did - if I heard a neighbor that I knew
well give out a sensitive item over the cordless, I would put a copy of this
article in their mailbox

The following by Bob Kay was published in the Jul 90 issue of
Monitoring Times. Bob suggested wide dissemination.

Dear Cordless Phone Owner:
...On a map of your town, draw a one mile radius circle around your
home. Did you know that anyone who lives within that circle and who
owns a scanner can listen to your phone calls? If you live in an
urban area, there could be hundreds of people listening to your every
word. The fact is that the one mile radius is rather conservative.
Cordless phone signals have been monitored at distances greater than
two miles.
...To the average person, the idea of cordless signals traveling a
distance of two miles seems rather ridiculous. After all, the
advertised operating range of a cordless phone is approximately 1500
feet. And if you're a cordless owner, you know from first hand
experience that your phone won't work beyond the limits of your back
yard.
...So how can someone with a scanner radio, living several miles away,
monitor your cordless phone? To answer that question, you need to
understand that the cordless phone is nothing more than an FM
walkie-talkie that flings your telephone conversation in all
directions. If atmospheric conditions are favorable, cordless phone
signals can travel for miles.
...The scanner radio that we use has the unique ability to capture,
receive, and amplify a variety of weak signals. Its sensitivity to
low power signals, like the one coming out of your cordless phone, is
further enhanced by the addition of an outside antenna. With the
proper equipment, it's easy to monitor an entire neighborhood of low

power cordless phones.
...Hobbyists who monitor the cordless bands quickly learn to match voices with specific frequencies. Local cordless frequencies can be cataloged in the same manner as regular phone numbers. For example: If a cordless phone is monitored on 46.610 megahertz, that particular frequency and the name of the person using it can be logged and retained in a cordless frequency book. It then becomes as easy to "tap" into a neighbor's cordless phone as it is to "punch up" his or her frequency on a scanner radio. (My Note): In addition to the above, if a person has the local "City Directory" handy, the scanner owner can then use his own phone to call around the neighborhood until he finds a busy signal while monitoring a cordless frequency. He then can match the frequency, phone number, address and name of the resident.
...By now, your probably wondering if it's legal to monitor cordless phones. The answer is, yes. A few months ago, the Supreme Court ruled that users of cordless phone's have "No justifiable expectation of privacy." Shortly thereafter, the Iowa Civil Liberties union stated that, "Consumers are purchasing cordless phones at the expense of their constitutional rights." (A very arguable opinion)
...To protect yourself from uninvited ease droppers, it's not necessary to throw your cordless phone into the closet. You only need to realize that the cordless phone should be utilized as a convenience, and not as a tool. If the phone rings when you're out in the garden, it's okay to answer that call on a cordless phone. But don't discuss personnel or financial matters. {(My Note): Never, ever give out your credit card numbers, bank account numbers, social security account number, calling card number or any "secret" number or information when using the cordless phone. Even something as simple as your birth date can add to a evil minded scanner listener's data base about you.} Simply ask the calling party to hold until you can get to a wire connected phone.
...However, there's more to protecting your privacy than most people realize. If you call your neighbor on a standard wire connected phone, and they answer on a cordless phone, your right to privacy doesn't exist. Why? Because your neighbor's phone is broadcasting both sides of the conversation into the air!
...For total protection against uninvited listeners, use a standard wire connected phone and don't forget to ask the second part to do the same. In today's high tech society, its the only guaranteed way of protecting your telephone privacy.

You ought to check the Alinco catalog before you go spewing insults around
here. The DJ-X1 is a **SCANNER** in the form-factor of the mini
handi-talkies, and it does have continuous coverage.

>I was going to buy a Pro-26 but the WS-1000 is very enticing.

I have one. What can I say - do you have specific questions. In general, it's the only pocket scanner worth having. However there are significant deficiencies in features; notably the inability to lock out scan channels from its four 100-channel banks, and the need to manually select frequency step when doing limit searches, since the auto defaults are set for Europe and they're invariably wrong on other continents.

As a general rule, tiny scanners have design compromises, and you wouldn't want to use one as your only rig. They make great second (3rd, 4th...) scanners for emergency and covert use.

Gerry Smith <w6ter@postoffice.worldnet.att.net> wrote:

>Can anyone help with NJ car to car freqs
>used during radar/laser operations?

>Gerry
>w6ter@worldnet.att.net

Hi Gerry,

This is an interesting question. In the past, the frequency 155.46 was used by the NJSP (especially the Turnpike and Garden State Parkway patrols) as a TAC-PAC radar car-to-car channel. It was known as channel "GREEN". I have not heard any activity for quite some time on this freq, however it is licensed to the state and may still be in use.

However, MOST car-to-car communications for the NJSP occur on the trunked radio system. Which means that you need to enter the current active frequencies for the system you wish to monitor (there are 3 in NJ - North, South, Central) and scan.

Actually the car-to-car channels (or talkgroups in trunking terminology) occur on the following:

TROOP A - South

A1-07 OPS Car-to-Car Primary
A1-09 INTOPS Car-to-Car Secondary
A4-14 C/CTP Car-to-Car Turnpike (this is the NEW GREEN)

TROOP B - North

B2-07 OPS Car-to-Car Primary
B2-09 INTOPS Car-to-Car Secondary
B5-14 C/CTP Car-to-Car Turnpike (this is the NEW GREEN)

TROOP C - Central

C3-07 OPS Car-to-Car Primary
C3-09 INTOPS Car-to-Car Secondary
C6-14 C/CTP Car-to-Car Turnpike (this is the NEW GREEN)

NOTE: The car-to-car primary and secondary talkgroups are used by the Troop cars and Marine Bureau units.

The Garen State Parkway also uses the following conventional 800 Mhz repeater channels (which are not part of the trunked sysem) for occasional chit-chat.

851.3375 GSPW-1
852.1625 GSPW-2

There is also a conventional frequency 866.3125 (9-TA/10-RP) that can be configured in either talkaround or repeater mode. This is used mostly for low power surveilence.

Finally, the SPEN channels used to be used for radar OPS for some troops including the Parkway. Try these:

154.68 SPEN-1
155.475 SPEN-2
154.725 SPEN-3
153.785 SPEN-4

Good luck! For more info on the NJSP including frequencies and talkgroup assignments for Troops A and C, please see my South Jersey Scanner page at http://www.voicenet.com/~jcardani/sjscan.htm

Also, a code list and unit identifier list is on my page.

I was in radio shack the other day checking out scanners with a friendly salesperson, and I set one to search between 894 and 914. To our mutual surprise, it kept stopping on what definitely were cellular phone conversations, even though the description of the radio indicated "cellular blocked". Tried it on another model with same results. I wonder if U.S. West is using frequencies it's not supposed to, or if RS scanners aren't really blocked. Anyone have other thoughts on this? BTW, intercepting cell phone transmissions, regardless of whether you are using a "blocked" scanner, is illegal ;) Scott.

Just ask your local Radio Shack salesman or other Scanner Dealer.
When selling a mobile scanner they are required to inform you if they
are not legal in your area so should know the law.
Also be aware that some states allow them but individual
cities/counties may not.

HOW DO YOU FIND THESE SCANNER FREQUENCIES?

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner. The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.]

I am often asked, "How do you find these frequencies?" Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books

The most convenient source of fire and police frequencies is the Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores for under $13. Police Call is basically a computer printout of FCC license information in the fire, police, local government, and conservation services in two lists: by licensee name within state, and by frequency. Later editions have included a few pages of local airport and nonsensitive federal government frequencies. The 1996 edition contains selected business frequencies, too, but callsigns are listed only for local government and public safety licensees.

I highly recommend Richard Barnett's 1992 book, Monitor America, published by Scanner Master Corp. A 3rd edition is expected soon and will be available from Grove Enterprises for about $30. This second edition is crammed

full of police, fire, local government, news media, sports, national park, and commercial broadcast frequencies for all 50 states. The information was compiled mainly from members of the world's largest scanning club, the Radio Communications Monitoring Association (RCMA). Monitor America contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns. A 3rd edition is expected in early 1995.

Scanner Master also publishes regional frequency guides for Illinois, Florida, Virginia, Massachusetts, New Jersey, and other states.

Aeronautical frequencies are covered in the Aeronautical Frequency Directory, written by Bob Coburn, W1JJO. Although most of the information is about civilian aviation, Bob included sections on military mid-air refueling and CAP. The 401 page third edition is available from Official Scanner Guides (P.O. Box 525-NS, Londonderry, NH 03053). The same publisher sells the Maritime Frequency Directory and frequency guides for several New England states. Some of these books are available through Radio Shack, too.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range. Since the US government no longer offers frequency information for its own stations, and has never published sensitive frequencies, most of the information in Kneitel's book has been collected from listeners over the years. It is certainly not complete, nor 100% accurate, but is a good book for this difficult to obtain information.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Magazines

Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times and Kneitel's sensationalistic Popular Communications.

Government Records

Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US Department of Commerce National Technical Information Service (NTIS).

These lists contain license information for the industrial (e.g. Illinois Armored Car, Pinkerton's Security, Joe's Towing, etc.), highway maintenance, commercial broadcast, aviation, common carrier, and maritime services, as well as for police and fire. For more info call NTIS at 703-487-4630.

Microfiche is not for the casual hobbyist, but rather for the ardent listener, who can easily spend a few hundred dollars for the fiche, not including the price of a microfiche reader.

Back in "the good old days," Grove Enterprises sold copies of some FCC microfiche files, and this was much cheaper than buying directly from NTIS. Grove no longer sells microfiche, but sells information on CDROM for $100 instead. In the 1995 edition, fields are different than PerCon's Spectrum CDROM. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on both floppy disks and CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The new PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. It works in DOS, Windows, and Mac environments. One can try restricted sample searches of the Spectrum CD for free via PerCon's web page at http://www.perconcorp.com/db_srch.htm .

Companies have appeared which are "plugged into" the FCC licensing system and they sell computer time allowing on-line file access. They also sell paper copies of FCC information. Washington Radio Reports is one example. A monthly publication, it lists license applications made to the FCC. A few members of my scanner club subscribe and share the information with me.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350

Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Federal Radio Stations - Not Licensed by FCC

Since federal government radio stations are not licensed by the FCC, they are not listed in FCC microfiche. In 1981, a group of 60 radio hobbyists split a $1300 fee, and obtained 80 microfiche cards of 'sanitized' information about federal government radio stations under the Freedom of Information Act (FOIA). (See "The Government Giveth, the Government Taketh Away", by Richard Prelinger, in Monitoring Times, July 1982.)

Only 12 of the 21 information fields for each station were furnished. Fields like "Remarks", which indicate the exact usage of a channel (e.g. "Sky Marshall's Net"), and "Bureau", indicating agency subdivision (e.g. TAC within the USAF), were withheld. These 80 pages of microfiche were sold by Grove Enterprises for $25, but are no longer available from that source. Private entrepreneurs have been known to ask $125 or more for a set! In a step backward, the US Government insists it will no longer release this type of information - it is now 'classified'. (See "AFIO and the FOIA", by Bob Grove, in Monitoring Times, September 1982.)

For a reason unknown to this author, the government released a 1984 vintage set of frequencies allocated to the FAA. Perhaps this was a mistake, because the information is marked 'unclassified', but all fields are furnished, including some which indicate security related usage. Grove sold this set of 33 microfiche cards for about $13.

Two way radio equipment formerly used by the armed forces often appears for sale at hamfests. Less often, Secret Service and FBI radios appear there from time to time, too. When you see such equipment, look over the radio for a frequency label and write down the frequencies stamped on the crystals or channel elements. Make note of any service or property tags which specify the agency or military base which used the equipment.

Radio Clubs

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than a pile of magazines.

Since the early 1960s, I had been an amateur radio operator, and belonged to amateur radio clubs, but I never realized there were any scanner clubs! In 1983, I joined

the world's largest scanner club, the Radio Communications Monitoring Association (RCMA), now out of business. There are several regional scanner clubs, spun off from the former RCMA, which hold regular meetings.

Another club which prints sensitive federal frequencies is the All Ohio Scanner Club. I enjoy its bimonthly publication, The American Scannergram, which is about 60 pages long. Although concentrating on Ohio, there is frequency information from other states, and plenty of product reviews and scanning tips.

More information is available from:

All Ohio Scanner Club
50 Villa Road
Springfield, OH 45503

Do Your Own Sleuthing

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio, or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

What Makes Station Identification Difficult?

In most instances, FCC rules require radio users to identify their operations with FCC assigned call letters. Police and fire departments, especially those with trained radio dispatchers, seem particularly conscientious about station identification. Like commercial broadcasters, many of these stations identify on the hour and the half hour.

Some repeater stations have Morse code identification circuits which transmit call letters on a periodic basis, insuring compliance with FCC rules.

On the other hand, over 75% the industrial radio stations monitored within the last year ignore the FCC regulation, making it difficult for a listener to identify a station. Some stations may operate for years using the nondescriptive "base to mobile 2" or "Joe to base" protocol. One rung up the hierarchy are stations that identify using something like "Acme base to 107", giving the listener a clue for his log. If call letters are given, they are often rendered unintelligible by operators who fail to enunciate. The failure to identify is more likely due to sloppiness, rather than any attempt to hide station identity.

While not regulated by the FCC, federal government radio stations vary in the extent to which they identify their transmissions. Some federal stations do not have call letters. A nearby paging transmitter periodically transmits a voice recording announcing, "This is the Army Joliet Ammunition Plant." What more could a listener ask for?

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy. I use two modified Radio Shack CTR-75 recorders, a discontinued model.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

If you don't have a VOX recorder, consider a device like the NiteLogger II tape recorder controller, made by Benjamin Michael Industries. It connects simply between scanner and recorder and contains sound activation circuitry to trigger the recorder.

The following examples illustrate techniques I've used to derive new frequency information.

Examine the FCC License on Premise

I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the Bell Labs security office and the guard shack at Waste Management's Greene Valley Landfill in Naperville.

Examine the Labels on Radio Equipment

Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find Dymo or P-Touch tape labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret.

- At the annual Glenview Naval Air Station open house, I examined a military manpack radio being used by dispensary paramedics. The radio's tuning dial was set at 34.15 MHz.

- The Illinois Army National Guard displayed two armored personnel carriers at the local county fair, each equipped with VHF-FM and HF-SSB transceivers.

In addition to a tuning control (VFO), the VHF-FM radio had a set of channel select pushbuttons, much like those in a car radio. I asked a guardsman a few questions about the radio, and he demonstrated the channel preset feature. A panel above the channel pushbuttons was labeled with the frequencies: 32.055, 34.45, 35.35, 40.55, and 40.60 MHz.

- An Army National Guard UH1 helicopter was displayed at the Marseilles armory "open house". The public was permitted to climb aboard, and observe the instrumentation and radio gear. A channel plate on the instrument cluster listed over a dozen frequencies.

Hobbyists are urged to exercise a modicum of restraint and good judgement. In New Jersey, a radio technician/hobbyist called to service a transmitter in a county building, noticed a new unattended repeater installation in the same room. Being curious about what frequency this repeater was on, he opened the access door to copy the frequencies from the radio's crystals. It turns out that this radio belonged to the US Secret Service, and opening the access door could have activated a "tamper alarm"!

The tech was skating on thin ice. He had nobody's permission to tamper with that equipment.

Another source of frequency information is as close as your nearest Radio Shack store. Some Radio Shack stores make a

local frequency list available to assist their scanner customers. Be sure to ask. Stores located in shopping malls almost always know the mall security frequencies. I often check the frequencies programmed into the floor model scanners, too.

Equipment to Determine Frequency Usage

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. Some models, including the Radio Shack PRO-2035, ICOM R7000/R7100, Bearcat 2500XLT, and Bearcat 250, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, another spectrum analyzer connected to a receiver IF stage, and a frequency counter for close-in work.

How Can I Determine To Whom I'm Listening? - An Example

While scanning the industrial frequencies in the 150 MHz range, a van driver was overheard communicating with "base" while driving around my town. The stations involved never used FCC call signs -- this would have made life a lot easier for me, and legal for them! (one may use FCC license microfiche, described earlier, to identify stations using call letters.) Transmissions were short and infrequent, so it was decided to tape record all transmissions on this frequency for several days to determine the station's identity.

During daylight hours, a modified Regency K500 scanner was left tuned to the target frequency, connected to a cheap tape recorder through a home built interface. Using a carrier operated relay, the tape interface supplied power to the recorder only during radio transmissions, so a day's worth of traffic could be compressed into a 45 minute tape.

Each day, the tape was played back and notes on names, locations, and activities mentioned during the day's

transmissions were taken. The van driver appeared to be making daily stops at a local bank and two shopping malls. A Walgreen's store seemed to be the only stop at one mall. A few times, "base" ordered the van "back to the Training Center." There were frequent references to "guests checking out", "dropping a guest off", and "instructor[s] missing a class". At times, "base" spoke with "security", who must have been using a walkie-talkie as his signals weren't strong enough to hear.

Was this a hotel? Calls to the three local hotels revealed that none provides shuttle bus service to the shopping malls. A call to the Walgreen's, inquiring about bus service to the store, drew another blank. During my shopping trips, I began to pay closer attention to vans with antennas driving through the parking lots.

I was leaving the mall one day, when a week's effort paid off. A maroon and white van, equipped with a VHF-Hi antenna, was dropping shoppers off at Walgreen's. A sign on the van's door read:

XYZ Central Training Center (XYZ is a pseudonym for the actual licensee name.)
Lisle, Illinois

I watched the driver pick up a microphone, and listened to him on my portable scanner checking back with his "base".

All the pieces fit: the "guests", the "classes", the "instructors". Mystery solved; I had been monitoring the customer training center for a large computer manufacturer. The training center has hotel rooms and dining facilities to accommodate students from out of state. As a convenience, shuttle van service is provided to local shopping malls.

Summary

Through books, government records, and radio clubs, scanner listeners can make use of frequency information compiled by others. Two-way radio users often fail to identify their transmissions properly, making it more difficult for listeners to know who they are monitoring. By examining radio equipment labeling, and monitoring and taping transmissions, scanner enthusiasts can unearth new information.

In defense of the movie's producers, they did use an "Iridium"
satellite cell phone during the latter part of their odyssey. Only
problem I see, Iridium is not operational and, AFAIK, the FCC hasn't
even settled on the frequency assignment yet! The televangalist
flip-phone over Amsterdam was too much!! At least Rich Dean Anderson
went to "121.5 MHz" after the missile hit.

REPAIR TIPS: BEARCAT SCANNER RADIOS

Copyright 1993 - 1996 by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in
part on CDROMS, in bulletin boards, networks, or
publications which charge for service without permission of
the author. It is posted twice monthly on the USENET
groups rec.radio.scanner, alt.radio.scanner,
sci.electronics.repair, and rec.radio.info. It is also
available electronically from the rec.radio.scanner ftp
archive on the official USENET FAQ library
ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.
The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.]

Introduction

The original Bearcat scanner line was manufactured by
Electra Company, a division of Masco Corp of Indiana. In
the mid 1980s, Uniden, a Japanese company, bought out the
Bearcat scanner line and Uniden's first Bearcat scanner was
the BC800XLT model.

Most of the models discussed in this article are
base/mobile units made by Electra during the 1970s and
1980s although some of the capacitor failures occur in the
Uniden BC800XLT, too.

Electra stamped all of its scanners with a manufacturing
date code on the rear of the cabinet. The code is comprised
of a single character (C = Cumberland, Indiana, P = Puerto
Rico), followed by four digits denoting year and week the
radio was built. For example, "P8422" denotes the radio was
made in the Puerto Rico factory during the 22nd week of
1984.

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Some schematic diagrams may be obtained from Uniden/Bearcat's parts department, (800)297-1023. Uniden currently charges a flat rate of $54 for scanner repairs. They will repair and return "out of warranty" items without an estimate unless the repair charges exceed the flat rate charges. The phone number for repair is also (800)297-1023.

If Uniden doesn't have a schematic, try obtaining a Photophacts from Howard Sams Publishing division of Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family owned company which repairs scanners and stocks parts for several older models, especially Electra/Bearcat and Regency brands, but they don't sell manuals or schematics. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

Common Construction

Most of the classic, metal-cased Bearcat base/mobile models were built using two printed circuit boards:

1. a "radio board" containing the synthesizer, RF, IF, and audio stages, and
2. a "feature board" containing the microprocessor controller and memory circuitry which gave each model its own personality.

Although there are various vintage radios boards, they all have similar circuitry.

Bad Solder Joints Common

Before addressing specific symptoms, circuit boards in the malfunctioning scanner should be inspected for poor solder joints.

The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20, BC211, BC210, and BC210XL models were hand assembled, and every one I've serviced had several connections that were either soldered poorly, or not soldered at all.

Resoldering joints on the ribbon cable connecting the RF and keyboard logic circuit boards in a BC250 attenuated the microprocessor/synthesizer hash noise noticeably.

A Bearcat 20/20 was experiencing periodic loss of memory on some, but not all channels. When the problem occurred, the frequencies on some channels would be completely changed. On other channels, the frequency would still be intact, but the channel would be locked out, and the delay toggled from "on" to "off". Some channels were not affected.

The 2 "AA" memory backup batteries, and their holder, tested good. Much time was spent tracing logic, heating and cooling components, and making voltage measurements.

One of the secondary leads from the power transformer was connected to the main circuit board through a hole drilled through foil traces on both the top and bottom sides of the board. A close examination revealed that this lead had been soldered only on the top of the board - the bottom side had never been soldered.

Soldering the lead on both sides of the board solved the memory loss problem.

Symptom: Blank Display

The BC300 scanner, and several other Bearcat models, employ a switching type power supply stage to generate plus and minus voltages in excess of 20 volts DC. When this switcher fails to function, the display goes blank, but the squelch control appears to work, and white noise can be heard in the speaker.

In almost a dozen of the BC300 and BC800XLT scanners I've fixed, C98, a capacitor in series with the primary of the switching transformer failed, causing the output of the supply to drop below the level needed to power the display. The switching transformer is mounted on the RF circuit board, and is much, much smaller than the main power transformer, which is usually fastened to the metal chassis. The 22uF/16V capacitor used for C98 in early BC300s was marginal, and was replaced with a 47uF/25V capacitor in later units.

I replaced the 22 uF capacitor in the switching power supply stage of a BC210XL which caused the same symptom. Other capacitors in the switcher stage have failed. C114, a 4.7 uF/35V tantalum capacitor failed in at least one BC250, causing the display to blank.

A more sinister problem affects the switcher in earlier models. The switching supply stage in the BC250 and original BC210 is driven by a clock signal derived from a custom Exar NC57902 divider integrated circuit (designated IC6 in the BC250 scanner). I've seen this divider IC fail in several BC250s, causing a blank display (except for a decimal point in the BC250's rightmost digit). This custom

IC is no longer available from Uniden.

Symptom: Invalid Frequency Displayed

A common Bearcat 250 malady is manifested by an invalid frequency displayed on the readout. This condition is temporarily "cured" by unplugging the AC line cord from the wall, then replugging it. This condition is symptomatic of a power supply problem in which Q204, a Texas Instruments TIP-29 located on the feature circuit board, fails.

A Philips ECG291 will work as a substitute for the TIP-29. Don't try a Radio Shack substitute, it hasn't worked. See Martin Toomajian's article, "Bearcat 250 Erratic Display Cure", in January 1987 Monitoring Times.

A similar problem in the Bearcat 20/20 was discussed previously in the section on bad solder joints.

Symptom: Squelch Won't Eliminate White Noise

Most Uniden/Bearcat base/mobile scanners feature an AUTO squelch position, actuated by rotating the squelch knob fully counter clockwise. The BC350 used a separate pushbutton switch for this purpose. These scanners use a flimsy potentiometer (designated R81 in BC300s) internally mounted on the RF circuit board, to set the level of signal required to open the squelch when in the AUTO position. This pot also has an effect on the squelch action in the non-AUTO mode, and determines at which point the squelch knob must be positioned in order to silence the radio.

Although the potentiometer is adjusted at the factory, changes in component values due to aging often necessitate readjustment of this internal pot. Misadjustment of this pot has been the cause of "no squelch" complaints in two BC300s and a BC250 I fixed.

Another squelch failure is due to a blown transistor that acts as the electronic switch in the squelch circuit. I replaced this transistor in only one BC300, so I don't know if this is a common problem.

Symptom: Scanner Completely Dead

In Bearcat scanners using an internal power supply (e.g., BC350, BC250, etc.), the main power transformer is connected directly to the AC line. Since the on/off switch is on the secondary side of the transformer, current flows in the primary as long as the AC line cord is plugged into an active AC outlet. These transformers contain an internal circuit breaker, not visible without unwinding (destroying) the transformer. The internal breaker is

known to fail prematurely in a batch of Bearcat power transformers.

If your scanner is completely dead, check the primary of this transformer for an open circuit condition.

Symptom: Keyboard Bounce

After much use, the Chromerics keyboards in Bearcat scanners start to wear out. The first sign of trouble is usually keyboard bounce on the most frequently used key, e.g., the MANUAL key. Replacement keyboards are usually available from UNIDEN, but replacement requires dexterity, as one must take care not to tear the flat, flexible strip connecting the keyboard to the logic board.

Symptom: Keyboard Completely Unresponsive

The keyboard matrix is "scanned" by the microprocessor. Another problem is when none of the keys seems to function; the receiver just keeps scanning in spite of key depressions. I found this condition in a BC210XL scanner owned by a heavy smoker. Perhaps nicotine smoke was to blame, as the resistance between two input port pins on the microprocessor was down to about 1000 ohms, fooling the microprocessor into believing that a key was stuck in the "down" position. Scraping the circuit board between the two pins with an X-Acto knife fixed the problem.

Uniden/Bearcat BC200XLT Portable
Loss of Audio and Dial Lamp

If you can program frequencies into your BC200XLT but there is no audio and the green backlight no longer functions, a tiny transistor may have failed.

Check for a defective PNP surface mount transistor, Q201 (2SB815B6-YDY). Q201 is used as a switch to furnish 8 VDC to several stages of the BC200XLT. Its main purpose is to switch off power hungry stages of the BC200XLT when the CPU thinks the NiCd voltage has fallen below a threshhold. That's an attempt to limit the current drain on weak NiCds to avoid permanent damage.

Q201 is located on the foil side of the "Micom" board, adjacent to the black multi-pin connector which mates the Micom and main boards together.

Q201 can be destroyed by a few different causes, primarily, by something in the scanner drawing too much current through it. In one case, capacitor C36 shorted. It's a 220 uF 10v electrolytic, located on the component side of the main board, connected from pin 8 of the audio IC (IC2

NJM386SL) to ground. In a pinch you bypass Q201 by soldering a short piece of bare wire between the collector and emitter.

Other Problems

Complaints of low audio output and occasional microphonics in three Uniden/Bearcat 800XLTs were caused by a bad 47 ufd electrolytic capacitor in series between the external speaker jack and audio amplifier.

Andy Domonkos reports he often uses a tape recorder connected to a Uniden/Bearcat BC890XLT. RL-1, the carrier activated relay inside the BC890XLT wore out. Andy found the identical relay sold at Radio Shack (part #275-232) and says the BC9000XLT uses the same relay, too.

Add a Plectron or Motorola Alert
Crystal Controlled Monitor Receiver
to Your Scanner Collection

by Bob Parnass, AJ9S

[NOTE: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author.]

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. They can be powered from 117VAC or 12VDC with the proper mobile cord. The audio quality of a Plectron P1, Plectron 700 series, and Motorola Alert Monitor is far better than any consumer grade scanner and the sensitivity, image rejection, and intermod immunity is outstanding when aligned properly.

The Plectron and Motorola Alert monitors are single band receivers: VHF-low, VHF-high, or UHF. No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, so there were versions optimized for each portion of the VHF-low band. There were different versions to cover low and high "splits" in the VHF-high band, too. Although UHF versions were made, they are somewhat rare and coverage is limited to 470 MHz and below.

Plectron made several models with dozens of different options. Both the original P1 and later 700 series are suitable for restoration, although I prefer the newer 700 models. The Plectron 500 "economy" series is less desirable.

The P1 series have black cabinets with a blue-green and silver color scheme used on the front panel. They were made in the Chief (tone decoder & carrier squelch), Patrol (carrier squelch only), and Sentry (tone only) models. The Sentry models lack a carrier squelch and therefore are of little use to hobbyists except for scavenging parts. Model number and frequency information appears on a gummed label on the rear panel:

Band (MHz) Chief Patrol Sentry

_____
25-54 R19 R15 R17
148-174 R20 R16 R18
450-470 R23 R21 R22

Table 1. Plectron P1 models

The R700 series have black cabinets with brown front panels and are slightly smaller than the P1 receivers. R700s were made in the Chief (tone decoder & carrier squelch) and Patrol (carrier squelch only) models:

Band (MHz) Chief Patrol

_____
25-54 R719 R715
148-174 R720 R716
450-470 R723 R721

Table 2. Plectron 700 models

The Plectron FM Receiver/Recorder is a collector's item. It is essentially a 700 series Chief receiver with a built in cassette tape recorder. The recorder is carrier activated and can tape transmissions while the receiver is unattended. A connector on the rear panel allows for all kinds of remote control possibilities.

I use two Plectron P1s and four R700s in my living room, seven R700s down the basement, and several Plectrons and Alert Monitors stored in reserve. The basement Plectrons are turned on automatically when someone walks downstairs. Power to them is controlled by a modified Radio Shack Safe House infrared motion detector, originally sold as an intrusion alarm.

When a rescue squad member from Missouri advertised a number of Plectrons on USENET, I bought them -- all 20+ of them. I cleaned, fixed, and restored each one. After recrystalling them on local frequencies, I distributed them to members of my scanner club who were glad to get them.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies

far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency.

AC power cords for both types of receivers use unique connectors and are scarce. You can buy them new but it's much cheaper to drill a hole on the rear panel and attach a permanent a power cord. Make sure you use a grommet in the hole to prevent the metal chassis from chafing the line cord.

Many Plectrons and Alert Monitors were equipped with an internal NiCd battery pack, intended to power the receiver if the AC power fails. It's unusual to find a used monitor receiver with the NiCd pack still capable of holding a charge. More often, the batteries have died and the series charging resistor has overheated and burned. Be sure to remove the dead batteries as they often leak.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

I have not used the Plectron tone alerting features so I cannot address that except to say that the special coils and capacitors for the dual tone decoders vary depending on the tone frequencies and are somewhat difficult to obtain. Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. You can also get Plectron repairs and parts from:

Northeast Communications
4 Oak Ridge Rd
Newfoundland NJ 07435
201-697-8804

Alert Monitor parts are available from Motorola. Phone (800)972-3226.

I currently have no Plectrons or Motorola Alert Monitors for sale. I'm hoarding them. :-)

IMPROVE THE SQUELCH IN YOUR MONITOR RECEIVER

Copyright 1988 - 1996 by Bob Parnass, AJ9S

[NOTE: The first version of this article appeared in the RCMA Newsletter, December 1988. It may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, sci.electronics.repair, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

The squelch control in some FM monitor receivers is difficult to use because of too much hysteresis. The American Heritage Dictionary of the English Language defines hysteresis as the:

o "Failure of a property changed by an external agent to return to its original value when the cause of the change is removed."

It's like having play in a car's steering wheel, or backlash in a gear set. Too much hysteresis in a squelch circuit forces one to keep the squelch at a tighter setting, missing weaker signals when scanning or searching. The squelch hysteresis problem was first addressed in a 1984 article about the Radio Shack PRO-24 crystal controlled scanner.

Why do engineers design these circuits with any hysteresis? Basically, hysteresis prevents weak signals from "popping" the squelch open and closed rapidly, which would be very annoying to the listener. A squelch circuit with hysteresis requires a stronger signal to open the squelch than it does to keep it open.

Models cursed with too much hysteresis include the Uniden/Bearcat 800XLT and 760XLT, Radio Shack PRO-2003, PRO-2004, and others. Don't despair, the fix is simple for most radios. I've successfully reduced the squelch hysteresis by replacing a single resistor.

Hysteresis is usually implemented by providing feedback from the squelch gate input to output, through a resistor. The higher the resistor value, the less feedback there is, and less hysteresis. My modification involves replacing the "stock" resistor with a higher value resistor, as identified in the table below.

This technique does not apply to some of the newer Uniden models, because the squelch hysteresis is partially determined by firmware inside the processor IC.

This article cannot provide step-by-step instructions for each radio. I always encourage radio hobbyists to purchase the service manuals for their equipment. The most useful sections of the manual are the schematics and printed circuit diagrams. Good manuals will also describe the theory of operation and alignment procedures, and contain a complete parts list.

If your radio has too much hysteresis, and is not listed in the table, study the service manual. Motorola MC3357, MC3359, and MC3361 integrated circuits, which contain IF and squelch circuitry, are popular in scanners. In these receivers, look for the hysteresis resistor to be connected to these ICs.

Notes

1. The author cannot furnish modification information for other radios.

2. Don't attempt this, or any other internal modification, unless you are skilled in electronic servicing.

3. Make sure your receiver is disconnected from any power source before opening the cabinet.

Table 1. Squelch Hysteresis Resistor In Selected Receivers

Squelch Hysteresis Resistor In Selected Receivers		
Receiver Model No.	Res-istor Value	Stock Comments
Radio Shack PRO-24	R35	33K replace with 220K. Located between pins 12 and 14 of MC3357 (IC1)
Radio Shack PRO-2002	R197	47K try 220K.
Radio Shack PRO-2004	R148	47K remove R148 or replace with 220K.

	On linear board,
	between pins 12 & 14

Abstract

This article contains product review summaries for more than
60 old and new scanner radios and monitor receivers. Other
topics include:

1. Motivation for buying a used scanner
2. A used scanner may be a broken scanner - where to get
it fixed
3. Evolution of the scanner
4. Obtaining crystals
5. Keyboard programmable scanners

The author writes a monthly "Scanner Equipment" column for
Monitoring Times magazine, published by Grove Enterprises,
but views expressed in this article are his own.

Introduction

Anybody with enough money can buy a brand new scanner, but
you can save lots of money if you get a good deal on a used
scanner. Hamfests are probably the best place to find used
radios, but you must be familiar with the equipment.
Hamfests are repleat with older radios you won't see in
today's catalogs.

At last count, there were over 140 scanners and monitor
receivers of various brands in my collection. I purchase

most of my receivers at hamfests or horsetrade with other radio hobbyists. This article describes a few of the FM receivers in my collection, and is not meant to be complete.

A Used Scanner May be a Broken Scanner

Getting a bargain is not without some risk. I have had sellers look me square in the eye and tell me their radio worked fine -- when it really didn't.

Buying a used portable scanner is riskier than buying a mobile or base model. Portable scanners are subject to more physical abuse and many have been dropped. If a radio has been dropped, the laws of probability dictate that the first point of impact was probably a corner, so be sure to examine each corner for evidence of trauma.

Scanners used in mobile service are subject to vibration, dust, and temperature extremes. This shouldn't dissuade you from buying a used mobile scanner, but be aware of possible complications.

You should have some recourse if the radio you buy turns out to be defective. For hints on fixing older Bearcat base scanners, see "Tips for Fixing Bearcat Scanners," by Bob Parnass, AJ9S, in March 1996 Monitoring Times magazine.

If you can't fix the radio yourself, you can pay to have the manufacturer or a service clinic repair it for you. Grove Enterprises (Brasstown, NC) and Radio Shack repair scanners, and Uniden can repair newer Bearcat models but often refuses to service older models, claiming they are "unrepairable" and carving the letter "U" on the cabinet.

G & G Communications (telephone 716-768-8151) is a family owned company which repairs scanners and stocks parts and crystals for several older models. They usually don't repair AOR scanners due to lack of manufacturer support. They are located at 9247 Glenwood Drive, LeRoy, NY 14482. (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com)

The re-incorporated Electra Corporation, (317)326-4419, is able to effect repairs on some older (pre-Uniden) Bearcat scanners. They sell crystals, antennas, power cords, owner's manuals ($11 ea). Electra Corporation is located at 251 N. 300 W. Greenfield, IN 46140-8496.

Evolution of the Scanner

It helps to understand some scanner history before shopping for a used scanner. You will likely see radios from many vintages at a hamfest, and should avoid buying early units

unless you are a scanner collector.

One of the earliest ancestors to the scanner was the converter. Manufactured by Tompkins (Tuneaverter), Petersen, Bearcat (Lil Tiger), Midland, and others, converters were made to operate in conjunction with AM radios. Then came wide band monitor receivers, in both tunable and crystal control models, like the Radio Shack PRO-2B. Truthfully, converters and tuneable FM receivers are interesting but don't work well by today's standards.

While tuneable receivers were in vogue, solid state technologies supplanted tubes. Better performing, narrow band crystal controlled units, like the Sonar FR-105, followed. These units did not scan, rather channel selection was accomplished using a simple rotary switch. Sonar even made a 24 channel unit, model FR-2513, in which crystals were held in a rotary "turret."

The earliest scanners, like the 1968 vintage Bearcat BCH, BCL, and BCU models, did not provide individual channel lockout capability. Electra didn't use the term "scanner" and instead called these innovative radios "business receivers." Other models, like the SBE Sentinel, employed a "Channel 1 Bypass" switch so a user could lockout channel 1.

The first scanners came in single band models, followed by multiband models. As two-way radio users started to populate the 450 - 470 MHz band, consumers were forced to pay a premium for UHF scanner coverage. Some multiband scanners, like the Electra's Bearcat III, required an optional circuit board for each band.

There were scanner mutations, designs which never evolved -- odd combinations of AM broadcast receivers with VHF-FM receive capability, like the flamboyant turquoise Sonar Sentry FR-103 portables, Lafayette Radio Electronics offered a few CB transceivers with VHF receiver capability. These poor performers didn't interest consumers of that era and you should avoid these models unless you are a scanner collector.

The first programmable (crystal-less) scanners were difficult to program. Users had to look up frequencies in a code book and tediously program the information into the scanner in binary form. Some models, like the Tennelec MCP-1 , Bearcat BC-101 , and Radio Shack COMP 100, resembled Altair or PDP-8 computers, with a row of 16 or so toggle switches. Instead of toggle switches, the Regency WHAMO-10 was programmed by breaking teeth from metal combs. The SBE Optiscan (and its Sears clone) required poking a series of holes in plastic cards which were then inserted into a slot

on the front panel.

Keyboard Programmable Scanners

Both Bearcat and Regency, as well as Radio Shack offer some good models. I would avoid the Bearcat 100, and older scanners made by AOR, JIL, Fox, Tennelec, and Robyn.

Scanner features often differ not only by model but by manufacturer. For instance, most Radio Shack and Bearcat programmables allow enable/disable of the delay function on a per-channel basis. Older Regency units permit the delay to be enabled/disabled only globally, that is, for all the channels at one time.

All the older Radio Shack scanners were made by General Research Electronics (GRE). Uniden began making scanner models for Radio Shack in the late 1980s, and now supplies about half the Radio Shack scanners. The older GRE-made models scan a bit slowly and have a higher level of synthesizer noise. Most have too much hysteresis in the operation of the squelch control, but this can be fixed completely by replacing one resistor. Good, detailed shop manuals are available for Radio Shack units for $5 - $12.

In the name of cost cutting, some models have done away with the concept of a "channel bank", i.e. the ability to select/deselect a group of channels at a time. The bank concept was a good one. It may be inconvenient to operate a 30 channel scanner without banks (e.g. Regency MX3000, HX1000) if you operate the way many scanner hobbyists do.

If you want to buy an American-made scanner, you will have to buy an old model. Until the mid 1980s, rivals Regency and Electra (Bearcat) built most of the scanners in their Indiana and Puerto Rican factories. Uniden, a large Japanese electronics company, purchased the scanner product lines of both competitors and moved production to Asia.

My favorite VHF/UHF receivers are the the Uniden/Bearcat BC9000XLT, the 400 channel Radio Shack PRO-2005 and PRO-2006, and the ICOM R7000, R7100, and R8500. The ICOM models are more "communications receiver" than a conventional scanner.

For portable use, I prefer Uniden/Bearcat BC3000XLT and older Radio Shack PRO-43.

Obtaining Crystals

If you do purchase a crystal controlled scanner or monitor receiver, you will probably want to buy more crystals to cover local frequencies.

Scanner crystals may be ordered from your local Radio Shack store or from one of the companies below. Be sure to specify the operating frequency you want and the brand and model of scanner.

Some companies may ask you to send a schematic of the scanner or require more detailed information, like series or parallel resonance, load capacitance, etc.

For more information about old scanners, see:

1. "Confessions of a Scanner Collector," by Bob Parnass, Monitoring Times, August 1988.

2. "Scanner Collector Primer," by Bob Parnass, Monitoring Times, May 1995.

I have published full length reviews of these scanner models in Monitoring Times magazine:

Mar 1986 - Uniden/Bearcat BC800XLT
Mar 1987 - Radio Shack PRO-2004
Oct 1990 - Radio Shack PRO-2006
Jan 1995 - Radio Shack PRO-2035 vs. Radio Shack PRO-2006
Feb 1995 - Radio Shack PRO-62 Portable
Mar 1995 - Uniden/Bearcat BC9000XLT
Apr 1995 - Uniden/Bearcat BC3000XLT Portable
May 1995 - Uniden/Bearcat BC860XLT
Jun 1995 - Uniden/Bearcat BC890XLT & Radio Shack PRO-2036
Jul 1995 - Radio Shack PRO-2037
Aug 1995 - Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT
Sep 1995 - Radio Shack PRO-60 Portable
Oct 1995 - AOR AR-2700 Portable
Nov 1995 - selected AOR AR-8000 measurements
Dec 1995 - Radio Shack PRO-2040
Feb 1996 - Radio Shack PRO-2042
Apr 1996 - Uniden/Bearcat BC220XLT, BC230XLT Portable
Jul 1996 - Uniden/Bearcat BCT-10 mobile
Oct 1996 - Radio Shack PRO-2046 mobile
Dec 1996 - Icom R8500
Jan 1997 - AOR AR5000

Note: Reprints of Monitoring Times articles are available for $2.00 each (plus self addressed stamped envelope) from Grove Enterprises, PO Box 98, Brasstown, NC 28902, tel. (800)438-8155. I don't receive any part of this $2.00.

AOR

AR2700: 1995 vintage. 500 channel portable covering 500 kHz to 1300 MHz. Lots of good features, e.g., 10 linkable search banks, lighted keypad, per-channel attenuator, S-meter, battery meter, optional voice recorder and speech inversion descrambler. Global rescan and pause delays, but no auto store, data skip, nor battery saver. Internally generated noise results in broad birdies on AR2700 tested. Insensitive carrier operated (vs. noise operated) squelch stays closed on signals unless they are moderately strong, causing scanner to skip transmissions of interest. IFs are 287.55/749.25, 58.05, 10.7/0.455 MHz. See "The AOR AR-2700 Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, October and November 1995.

AR5000: 1996 vintage. approx. 30 kHz - 2600 MHz coverage super receiver. Good sensitivity throughout. AM, SSB, CW, FM detectors. Frequency readout to 1 Hz. More features than other radio. DTMF reader and RS-232 interface included. Multiple settings for IF and AF selectivity, attenuator, AGC, deemphasis, etc. DB9 RS232C connector. Negatives include low contrast LCD display and difficult user interface. NFM squelch closes slowly, causing noise burst at end of each NFM transmission. Electromechanical

relays click at various frequency boundaries, including 400 MHz, producing a clickety-clack noise -- annoying while scanning banks of mixed band frequencies. Great radio, otherwise.

ICOM

R-7000: 1986 vintage. At about $1000, this was once the top VHF/UHF receiver. 99 channel, multi mode coverage from 25-2000 MHz with a small gap at 1000-1025 MHz. Memory can be expanded to 198 channels by adding simple switch to pin 19 of memory IC8. Tuning knob lets you tune through parts of the spectrum much easier than using the SEARCH mode on conventional scanners. Selectable USB/LSB allows reception of new amplitude compandored sideband (ACSB) stations. S-meter doubles as discriminator meter to aid tuning. Useful search and store feature, reminiscent of the the Bearcat 250, searches between 2 limits and automatically stores new frequencies into channels 80-99. Audio and control interface for tape recorder. Noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Searches and scans slowly but can be sped up to about 12 cps by adding a resistor. Too big for permanent mobile use, but too nice to leave alone in the car. If you don't want to spend $1000, get a Radio Shack PRO-2004/5/6 instead.

R-7100: 1992 vintage. At about $1300, this is the Cadillac of VHF/UHF receivers. 900 channel, multi mode continuous coverage from 25-2000 MHz. The radio RF/IF/AF portions of the R7100 are similar to the older R7000, but the R7100 is constructed using surface mount parts. Both the R7000 and R7100 are much more immune to intermod than the Uniden/Bearcat 760XLT and the portable PRO-43. The firmware in the R7100 is much more sophisticated. 9 banks of 100 channels. Further, you can associate each channel with 1 of 10 groups. Many possible ways to scan. 10 pairs of search limits. Search and store ("memory write") scan mode lets you store 100 frequencies instead of the 20 in R7000. Another R7100 improvement is that you can program up to 100 channels for the R7100 to skip while searching. R7100 has 2 VFOs ("windows"). Both the R7000 and R7100 scan slowly compared with PRO-2004 and PRO-2006, and that's a drawback. Both the R7100 and R7000 employ a noisy relay, activated when the receiver is tuned to frequencies above 520 MHz. Scanning a mixture of VHF and UHF frequencies serenades the Icom user with a very annoying clickety-clack, clickety-clack!

R8500: 1996 vintage. 100 kHz - 2000 MHz coverage. 20 banks of 40 channels although bank sizes can be changed. 100 Auto store and 100 Skip memories but that can be increased by

reallocating channels from the conventional scan banks. Fixed and programmable step sizes. Relays clickey-clack while scanning across band boundaries. Triple conversion, First IF is 48.8, 778.7, or 266.7 MHz, depending on band. Second and third IFs are 10.7 and 0.455 MHz. Rugged construction. External power supply. DB25 RS232C connector. Ok scanning and great searching performance.

UNIDEN/Bearcat and Electra/Bearcat

Bearcat III (Electra): 1976 vintage. 8 channel crystal controlled scanner. Requires optional front-end circuit board for VHF-low, VHF-high, and UHF bands, but only 2 boards can be installed within the radio at the same time. Two crystal filters. No aircraft band coverage nor rescan delay. Front mount speaker sounds good. Strong local oscillator radiation often causes interference with other scanners in the same house.

Bearcat IV (Electra): 8 channel crystal controlled scanner. Newer version of Bearcat III but contains front-end circuitry for VHF-low, VHF-high, and UHF bands. Better selectivity than Bearcat III or 12 due to having three instead of two 10.8 MHz IF filters. No aircraft band coverage. Front mount speaker sounds good. No rescan delay.

Bearcat 5 (Electra): 1979 vintage. Eight channel economy base model covering VHF-low, VHF-high, and UHF bands. 117 VAC only. No track tuning. Black plastic cabinet.

Bearcat 6 (Electra): Six channel VHF-low and VHF-high bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 8 (Electra): Eight channel VHF-low, VHF-high, and UHF bands. 117 VAC only. Wood covered particle board cabinet.

Bearcat 12 (Electra): 1979 vintage. One of the last decent crystal controlled scanners. 10 channels. Variable scan speed up to 20 ch/sec. Single delay on/off switch. Front mount speaker sounds good. Manual contains schematic. Single conversion, 10.8 MHz IF. Selectivity is poorer than programmable models, like the 300, allowing adjacent channel interference. Covers VHF-low, VHF-high, and UHF bands but no aircraft band coverage. Crystal positions must be arranged by band.

Bearcat 15 (Electra): 1983 vintage. Actually made for Electra by competitor GRE (General Research Electronics). The only Bearcat crystal controlled base/mobile scanner offering 118 - 136 MHz AM aircraft band. 10 channels.

BC101 (Electra): 1975 vintage. First Bearcat synthesized unit. 16 channels, no priority. Frequency programmed in binary by setting toggle switches on front panel after looking up code in code book. No frequency readout. Uses custom IC for CPU, now discontinued, so factory authorized service is no longer available. I have four of these units. DC operation requires optional mobile power supply.

BC100 (Electra): First programmable portable scanner. Be prepared for at least one repair in the first year. Early units, with threaded antenna connector, have high frequency of repair, particularly LCD readout, keyboard, and battery holder. No battery backup. Poor case design in early units caused battery to disconnect from radio, resetting microprocessor and clearing memories. No priority channel or aircraft band. Some people swear by the BC100, others swear at them.

BC210 (Electra): 1979 vintage. First Bearcat scanner with a keyboard and numeric display. LED readout.

BC220 (Electra): 1979 vintage. 20 channels. Reasonable number of features but 20 channels doesn't seem enough. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC20/20 (Electra): 1981 vintage. Similar to BC220 but with 40 channels and different CPU circuitry. A maximum of 20 channels can be scanned at one time. Reasonable number of features. Service Search for Marine and Aircraft. LED readout. Good scanner, but tinny audio.

BC250 (Electra): 1976 vintage. 50 channel model, rich in features, but lacks aircraft band and 144-146 MHz. Search and Store feature extremely useful for finding federal frequencies. Clock. High frequency of repair. Power transistors not heat sinked adequately, causing heat damage to surrounding components and circuit board. Failure of Q204 on the feature board known to cause odd display readings. Digital circuitry very sensitive to glitches caused by static and AC line spikes. Avoid 1978 or earlier vintage units. All BC250s use custom ICs (e.g., IC6, a divider chip, mfd. by Exar), which are now discontinued, so factory service is no longer available from Uniden.

BC260 (Electra): 1983 vintage. Super heavy duty metal cabinetry and lit controls, aimed at mobile use for firemen, police, etc. Few frills, only 16 channels, no aircraft, but generous coverage of federal bands omitted in the older Bearcat scanners. Good sensitivity. Lots of audio. Good internal construction. Backlit keyboard allows operation in the dark, but the keyboards on some units require high pressure to operate. Brightness control for display and

keyboard, but multiplexor circuitry for vacuum fluorescent display produces audible whine which may be annoying in a quiet room. Backlighting may fail in some units due to poor contact on connector used to fasten light panel to front circuit board. 9 volt regulator transistor Q28 (TIP29) may fail, causing blank display while leaving audio intact. Method of connecting an external speaker is awkward.

BC300 (Electra): 1979 vintage. 50 channel top of the line scanner. Service Search feature contains 11 ROM banks of preprogrammed channels Switching power supply failure noted in early units due to insufficient capacitance - component value was changed in newer units. Schematics show at least 100 components changed between earliest and later units. Preset squelch pot, mounted internally on circuit board, misadjusted in new units - adjustment usually required after burn-in period. Good sensitivity. Built in clock. I leave it on 24 hours a day. This is a favorite.

BC350 (Electra): 1981 vintage. 50 channels in 5 banks. Includes aircraft. Used to be Bearcat's top of the line, overpriced scanner but never very popular. Dual use keyboard and display allowed 8 text characters to be associated with each channel, a feature clumsily implemented, and awkward to use. Units plagued with various hardware problems including bad memory ICs and short life power transformers. Firmware bugs without cures. The BC300 is a much better scanner than the BC350, and at a lower price.

BC760XLT (Uniden): Also sold as BC950XLT through Scanner World. Small, mobile scanner supplied with mounting bracket and wall wart AC power supply. Some of the keys are backlit. 100 channels in 5 banks. Service search. Earlier version has Motorola type antenna jack and AA battery backup. Later version has BNC antenna jack and internal lithium battery. Can be fitted with optional CTCSS decoder. Hyper sensitive and easily overloaded by strong signals, especially when used with outdoor antenna in base applications. Conventional 10.8 MHz IF prone to images. Television audio heard in some places.

BC800XLT (Uniden): 1985 vintage. 40 channels in two banks. Covers 806-912 MHz, as well as of vhf, uhf, and aircraft bands. Receives 10 meter fm and all of 6 meters, as well as federal portions of vhf and uhf bands. Fewer birdies on vhf-lo band than other scanners. Scans and searches very fast. Clean, robust audio output. Extremely sensitive, but very prone to overload by strong signals when connected to outdoor antenna. Too much play (hysteresis) in squelch adjustment - can be improved by changing one resistor.

Positive terminal in memory backup battery holder installed backwards in early units, allowing memory loss when scanner unplugged from AC outlet. Tunes in increments of 12.5 KHz on 800 MHz band, whereas cellular telephones are on 30 KHz channels. See "The Bearcat 800XLT ... an Owner's Report," by Bob Parnass, in Monitoring Times, March 1986.

BC860XLT (Uniden): 1995 vintage. 100 channel table top unit. Can lock out 10 channels during search. Good performer except for images. See "The Uniden Bearcat BC860XLT," by Bob Parnass, AJ9S, in Monitoring Times, May 1995.

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning knob. 200 channels, global delay. Count, AUX, and Auto Store features. Scans and searches fast. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

BC9000XLT (Uniden): 1995 vintage. High quality base using up-conversion. 500 channels in twenty banks. Up to 250 channels can be programmed with alpha labels. Tuning knob. Selectable AM, NFM, WFM modes. Optional CTCSS decoder. Very fast scan and search. Can lock out 50 channels during search. Delay and attenuator independently programmable for each channel. Effective Auto Store feature stores unique frequencies. Good RF section, but not as robust as PRO-2004/5/6. IFs are 380.7/254.4, 58.075, 0.455 MHz. One urban user, located within a couple of blocks of several high power transmitters, reports severe desense problems. See "The Uniden Bearcat BC9000XLT," by Bob Parnass, AJ9S, in Monitoring Times, March 1995. For tips and modification information, see my column in June 1996 Monitoring Times.

BC100XLT (Uniden): 1987 vintage. Very good 100 channel portable with 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Generous coverage of conventional bands, including commercial aircraft, but no 800 MHz. Decent leather-like case. Slide-on 550 mAH NiCd battery pack.

BC200XLT (Uniden): 1987 vintage. Also sold as BC205XLT through Scanner World. Very good 200 channel version of BC100XLT portable scanner but includes 800 MHz band. 10 priority channels. Unique feature tells whether a given frequency has already been memorized. Decent leather-like case. Slide-on NiCd battery pack.

BC220XLT (Uniden): 1995 vintage. Very good 200 portable scanner which is a smaller successor to the BC200XLT. Includes 800 MHz band. 10 priority channels. Service Search, including WX. Up to 10 frequencies can be locked out during conventional search, 20 frequencies from Service Search. Unique feature tells whether a given frequency has already been memorized. 10.8 MHz and 450 kHz IFs, with images 21.6 MHz away. 4 cell BP-120 internal NiCd battery pack. Marketed as BC230XLT with two BP-120 battery packs and CRX-120 dual charger. See "The BC220XLT/BC230XLT Portable Scanner," by Bob Parnass, AJ9S, in Monitoring Times, April 1996.

BC230XLT (Uniden): See BC220XLT.

BC2500XLT (Uniden): 400 channel portable with tuning knob. Plagued by intermod and images. Early units drained batteries quickly even while turned off.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel portable with 20 banks. Up conversion. Very fast scan, search, and intelligent Auto Store. Mode, attenuator, and delay settings programmable for each channel. 50 frequencies can be locked out during search. Larger speaker than PRO-26 produces better, crisper audio. See "The Uniden Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, April 1995 and "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

Regency

TMR series: First generation crystal scanners. Come in all varieties of band coverage. Models with both UHF and VHF bands must use separate antennas for each band (disadvantage in mobile installations, but can be overcome by connecting two front ends via a capacitor). Not sensitive enough to cover the entire 30 - 50 MHz range in a single model. There three versions of VHF-low band coverage depending on the part of the 30 - 50 MHz band covered (LL, LM. and LH). TMR scanners use unsocketed incandescent bulbs for channel indicators which require periodic replacement. Easy to crystal: Radio Shack crystals work well. TMRs usually $2 and up at hamfests, often in poor condition. Don't pay more than $50, even if mint. Front ends must be tuned for selected portions within the bands for best sensitivity. Wide IF selectivity troublesome in urban/suburban areas. Primitive digital scanning circuitry may become confused at times. but power off/on restores sanity. Replace aging capacitors in the scanning circuits. You can find a TMR8H eight channel high band unit most often.

TME series: The base versions of the TMR models. Both the TME and TMR models share many common circuits but the base versions contain speakers mounted on the front panel. The most common TME model is the TME8 H/LM eight channel dual band scanner in a metal cabinet with wood coloring.

ACTR series: Replaced the Regency TMR units. By the time Regency made the ACTR units, they no longer offered different models for different parts of the 30 - 50 MHz band. Look for the later ACT series, e.g., ACTR-106 (10 channel tri band) or ACTR20/6 (20 channel tri band), used light emitting diodes for channel indicators instead of incandescent bulbs. Available in 1 to 20 channel models - most are multi band receivers. Somewhat wide selectivity. Not all that bad a deal if cheap.

ACTE series: The base versions of the ACTR series. The ACTE and ACTR circuitry is similar, although the base versions contain speakers mounted on the front panel. The most common ACTE model is the ACTE8 H/L eight channel dual band scanner in a black metal cabinet.

WHAMO-10: Regency's first synthesized scanner. Appearance more like a crystal scanner, with a single LED per channel. User has to break off teeth on a metal 'comb' for each channel according to a code book. External frequency control unit DFS-5K optional. UHF VCO reference oscillator drifts on some units. Soldered sheet metal shields around some circuitry make access to some components difficult for servicing. Comb sockets prone to bad connections after moderate use. Not recommended due to maintenance difficulties.

K500: Nice wood-like cabinet. 40 channel model with every feature Regency could dream of in one scanner, except aircraft band. Idle tone bypass feature for mobile phone stations works about 50% of the time. Weather alert feature. Service Search in several banks. Search and Store facility not implemented as well as BC250, but better than none. Built in clock when radio off or in manual mode. Can be programmed out of band. Reasonable performance, but sensitivity could be better. Spring contacts on membrane keyboard may need soldering after prolonged use.

K100: Bare bones version of the K500. 10 channels, no priority feature. Same wood-like cabinet and reasonable performance as K500. Spring contacts on membrane keyboard may need soldering after prolonged use.

M400: 30 channel replacement for K500. Service Search, but no aircraft. Easily programmable out of band. Built in clock when radio off or in manual mode. Backlit keyboard good for night viewing and mobile use but generates RFI into nearby

SW receivers. A favorite.

MX3000: 30 channel replacement for M400, but basic features only. Nice lit keyboard, but may cause RFI into nearby SW receivers. Easily programmable out of band, but no aircraft. All 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Good first scanner.

M100: 10 channel unit. Same as MX3000 except different color and fewer channels. Nicely lit keyboard, but may cause RFI into nearby SW receivers.

HX1000: Good, fairly rugged, 30 channel handheld synthesized unit. Generous out of band coverage but no AM aircraft coverage. Built by Azden. Very sensitive on UHF, but annoying audio hiss leaks through speaker when squelched. Belt clip chintzy, but can be directly replaced with better clip from Kenwood TR2600A. Like the MX3000, all 30 channels are in a single bank, and lack of direct channel access make this model more difficult to operate. Low discount price makes this best choice for programmable portable.

HX650/H604: 6 channel crystal portable. Likely made by Sanyo. Same as Fannon and Bearcat Thin Scan units, (except that Bearcat has 10.8 MHz IF frequency, and is harder to get crystals for), but scans faster. Small size and common crystals (available at Radio Shack), make this 1st choice for bare bones portable scanner.

Radio Shack

PRO-2004: 1986 vintage. Top of the line, wide band scanner for 1987. After a diode is cut, enjoy continuous coverage from 25-520 and 760-1300 MHz, AM, NBFM, and WBFM. Has 300 channels in 10 banks of 30, backed up by conventional 9 volt alkaline battery. Any channel can be designated the priority channel. Scans and searches fast. Lots of well designed features, like 10 pairs of search limits, Lockout Review, default search increment and emission mode. Sound Squelch allows skipping dead carriers during search or scan. Metal cabinet, good internal construction and shielding, but no mobile mounting bracket or DC power cord. Soft touch membrane keyboard. Good sensitivity and selectivity. Very good radio. See "Product Review: The Radio Shack PRO-2004 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, February 1987, and Monitoring Times, March 1987.

PRO-2005: 1989 vintage. Essentially a size reduced PRO-2004 with surface mount components and 400 channels. Some people think the small knobs, smaller display, and plastic cabinet are a setback from the 2004. The smaller size, real rubber

keyboard, and vertical front panel make it easer to use mobile, although the keyboard is not backlit. More sensitive than the PRO-2004 but 800 MHz signals leak through into the commercial aero band. Highly recommended. See "Product Review: The Radio Shack PRO-2005 Programmable Scanner," by Bob Parnass AJ9S, in The Radio Enthusiast, June 1989, and RCMA Journal, August 1989.

PRO-2006: 1990 vintage. Essentially the same as PRO-2005 but scans faster. Probably the best scanner made to date. Highly recommended. See "The Realistic PRO-2006," by Bob Parnass, AJ9S, in Monitoring Times, October 1990.

PRO-2035: 1995 vintage wide coverage base made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. Broader IF selectivity than PRO-2006. Poor dynamic range. 10 linkable search banks. Dumb Auto Store feature stores the same frequencies over and over. Wastes time scanning empty channels. See "The Radio Shack PRO-2035 - How Does It Compare With the PRO-2006?," by Bob Parnass, AJ9S, in Monitoring Times, January 1995.

PRO-2040: late 1995 vintage 100 channel base made by Uniden. Fair performance, but minimal image rejection. Local oscillator harmonics account for spurious responses, e.g., reception of cellular telephone calls in the 460 MHz UHF-high band. Scans over 40 channels/sec. Can lock out up to 50 channels from search. "Soft" on/off power switching via keypad. See "The Radio Shack PRO-2040," by Bob Parnass, AJ9S, in Monitoring Times, December 1995.

PRO-2042: 1996 version of the wide coverage PRO-2035 base with improved firmware and amber display. Made by GRE. 1,000 channels, but cumbersome 100 channel bank size. Tuning knob. NFM selectivity is still a problem but improved over PRO-2035. 10 linkable search banks. Smart Auto Store feature stores the unique frequencies. Can lock out up to 200 frequencies from search. Query facility indicates if and in what channel a frequency is programmed. Scan skips over empty channels automatically. Can sort memories by frequency within a given bank. IFs are 609 - 612, 58.05, and 10.7/0.455 MHz. Broader IF selectivity than PRO-2006. Overall, a top grade scanner and second only to Uniden/Bearcat BC9000XLT. See "The Radio Shack PRO-2042," by Bob Parnass, AJ9S, in Monitoring Times, February 1996.

PRO-2046: 1996 vintage 100 channel mobile made by Uniden with fairly good performance. Descendent of the BC760XLT but no CTCSS option available. Ten banks of ten channels. Scans memory at about 34 channels/sec. Service search, direct search, and band search. Preset search limits by band and user cannot program the search limits. Image

rejection is minimal, as one would expect from a scanner with IFs of 10.85 and 0.450 MHz. 10 Monitor memory channels. Can lock out up to 20 channels from a search. See "The Radio Shack PRO-2046," by Bob Parnass, AJ9S, in Monitoring Times, October 1996.

PRO-34: Portable scanner with 200 channels and 800 MHz coverage. Ten "monitor" channels. Operates from AA cells. Slow scanning, low audio output, and chintzy plastic case detract from an otherwise good performance. No decent leather case available from Radio Shack. If you need a portable with 800 MHz, get a Bearcat 200XLT. If you can't get a 200XLT, get a PRO-34.

PRO-2021: Base/mobile scanner. 200 channels in 10 banks, LCD display and raised rubber keys. Lots of memory but scans too slowly and lacks 800 MHz. Ten "monitor" channels. Radio Shack seemed to have an overstock of 2021s as they were on sale for such a long time. Close out price dipped to about $200, which made it a nice scanner for beginners.

PRO-2022: Base/mobile scanner. Like the PRO-2021 but includes the 800 MHz band. Cellular images throughout the 847.6 - 869 MHz range. Includes power saver circuit, odd for a base unit, which can clip the first part of a transmission. See September 1996 Monitoring Times for modifications.

PRO-2036: Same as Uniden/Bearcat BC890XLT. Tuning knob. 200 channels, global delay. Scans and searches fast. Count, AUX, and Auto Store features. Accepts optional CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IFs -- lots of images and birdies. Prone to severe intermod, especially when used with an outdoor antenna. See "The Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass, in June 1995 Monitoring Times.

PRO-2037: 1994 vintage. Triple conversion all plastic base scanner made by GRE. Home version of the PRO-62 portable but with more intermod. 200 channels in 10 banks, one search bank, selectable AM and FM. Uses up conversion circuitry but inadequate front end filtering still allows images, though not as bad as in 10.7 or 10.8 MHz IF circuits. Crisp, respectable audio given the top mounted speaker. See "The Radio Shack PRO-2037," by Bob Parnass, in July 1995 Monitoring Times.

PRO-2001: Early, single bank 16 channel programmable. Reasonable coverage of the 3 traditional bands, minus aircraft band. LED digital display as well as an LED per channel. Mechanical lockout switch for each channel. Delay is either on or off for all channels at a time. High

synthesizer noise level. Troublesome plated through holes on digital board in some units renders radio virtually unfixable. Could never get mine to work more than a few days in a row; always another bad connection. Some owners have no trouble.

PRO-52: 8 channel VHF-Lo/Hi base unit. No UHF band or provision for mobile operation. Good little scanner despite limited frequency coverage and Spartan lack of frills. Crisp squelch action and good audio, helped by a front mounted, vertical speaker.

PRO-2003: Radio Shack's 1986 top of line. 50 channels + 10 FM commercial broadcast band channels. Includes aircraft. Good frequency coverage and functionality, but at a high price. Poor human engineering: difficult to read keyboard makes the PRO-2003 hard to operate unless in a well lit room. Keyboard label coloring improved on newer units. Rather slow scan rate and high price. Although there are provisions for 12VDC operation, the cabinet shape and lack of mounting bracket makes mobile operation impractical. Scan rate only 8 channels/sec vs. 15/sec in Regency and Bearcat. Causes RFI: Plastic case permits scanner to radiate signals into nearby receivers.

PRO-43: Very good portable made by GRE. First Radio Shack portable with up conversion, and 222 MHz ham and 225 - 400 MHz military air band coverage. 200 channels, single search range. Small, convenient size. Muffled audio. Speakers in early units known to fail and more powerful speakers were used in later units. 800 MHz band coverage fully restorable in early units by removing diode. Uses same 6 cell battery tray as other high end GRE portables. Subject to interference in 160 - 162 MHz range.

PRO-60: 1995 vintage. Very good portable made by GRE. 200 channels, single search range. Similar features and same IFs as the PRO-43 it replaced but the PRO-60 has wider frequency coverage and crisper audio. Covers 75 MHz and commercial FM broadcast bands. Improved Direct search can be stepped manually in single steps. Uses same 6 cell battery tray as other high end GRE portables. Railfans take note -- the PRO-60 and PRO-43 are subject to interference in 160 - 162 MHz range. Draws 100 mA while scanning. See "The Radio Shack PRO-60 Portable," by Bob Parnass, AJ9S, in Monitoring Times, September 1995.

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 | crystal controlled portable bearing the same model number.) Very good portable made by for Radio Shack by Uniden. 200 channels, very fast scan/search. Good display. Covers all TV channels, but spectrum adjacent to cellular phone band is

censored which prevents monitoring parts of some trunked systems (e.g., IL State Police district 4). Up to 50 frequencies can be skipped during search. Limited image rejection causes 929 MHz paging interference in 170 MHz range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz. Audio suffers from small speaker. See "The Radio Shack PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring Times, August 1995.

PRO-62: 1994 vintage. Good portable 200 channel scanner using up conversion. Similar to PRO-43 but no military air band, different upper frequency limit, and slightly different IFs. Selectable AM/NFM modes. Better intermod immunity than PRO-43. See "The Radio Shack PRO-62," by Bob Parnass, AJ9S, in Monitoring Times, February 1995.

PRO30: 16 channel programmable portable with aircraft band. Good frequency coverage. Extra controls on top allow control of SCAN, MANUAL, and PRIORITY functions while worn on belt. Good belt clip. Low audio output. Plastic case prone to break at BNC antenna connector under severe use, vs. metal frame in Regency HX1000. High price, no discounts or sales yet. I had 6 or 7 PRO30s, having to return them several times during the 1 year warranty, although other owners have had little or no trouble. Troubles included oscillation in IF stage, no UHF band reception, case broken around base of antenna connector, etc.

PRO-24: 1983 vintage. Only 4 channels in this crystal controlled portable. Covers the three basic bands, but no aircraft. Easy to obtain batteries and crystals. Characteristic Radio Shack squelch problem, fixable by changing one resistor. All-plastic case larger than Bearcat Thin Scan and clones. See "The Radio Shack PRO-24 Scanner," by Bob Parnass, excerpted in the "Technical Topics" column, RCMA Newsletter, February 1984.

Craig (division of Pioneer)

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Sonar:

Sonar made several crystal controlled scanners and channelized monitor receivers which shared the same RF

circuitry. Each radio was housed in the same size metal case and worked on both 120 VAC and 12 VDC. The models differed in the number of channels, the band coverage, and whether individual channels could be locked out.

Although they used a 10.7 MHz first IF, Sonar radios require parallel resonant crystals different from the common series resonant crystals used in Regency and Radio Shack scanners. Some Radio Shack crystals will work in Sonar units, but more often they oscillate a few kHz off frequency and are unsuitable unless changes are made to the oscillator circuitry. Therefore, beginners should avoid these radios. Typical Sonar squelch has long time constant causing a long noise burst at the end of each transmission.

FR-104, FR-105: 6 channel monitor receivers covering 25 - 50 MHz or 150 - 175 MHz. Manual channel selection, i.e., no scanning. Early models are identified by an 11 pin connector on the rear and they could be used with an optional NiCd battery pack and charger which bolted to the rear panel. Later models used Cinch Jones connectors with flat contacts. Optional tone decoder board.

FR-2512, FR-2513: 24 channel versions of the FR-104 and FR-105 monitor receivers. Manual channel selection, i.e., no scanning.

FR-2514, FR-2515: 8 channel scanners. Channel 1 priority. Recommend you avoid these models as there is no way to lockout a channel from the scan sequence.

FR-2526, FR-2526, FR-2528: 10 channel scanners covering various combinations of 3 bands. Each channel could be locked out. Channel 1 priority.

Sonar Model	#chan- nels	VHF low	VHF high	UHF scans?	lock- outs?
FR104	6	X		no	
FR105	6	X		no	
FR2512	24	X		no	
FR2513	24	X		no	
FR2514	8	X		yes	no
FR2515	8	X		yes	no
FR2526	10	X		yes	yes
FR2527	10	X	X	yes	yes
FR2528	10	X	X	yes	yes

Table 1. Summary of Sonar base/mobile monitor and scanner receivers

Tennelec

Manufactured the first synthesized scanners. Company went out of business several years ago. Schematics and parts difficult to obtain. Radios reputed to be poor performers. Got my MS-2 and MCP-1 basket cases for free and sometimes regret taking them. Not worth fixing unless you have access to DTL/RTL chips and circuit diagrams.

Plectron and Motorola Alert Monitor Receivers

In the 1960s and 1970s, thousands of firemen and ambulance squad members came to rely on their transistor Plectron and Motorola Alert monitor receivers. They have now been replaced by portable pagers, and are often available at hamfests in the $5 - $25 range. Since many are in rough condition and need repair, a hamfest special is better suited for hobbyists who like to fix their own radios.

Plectron and Motorola Alert crystal controlled receivers are excellent for dedicated monitoring of local frequencies -- a task for which you wouldn't want to tie up your 400 channel programmable scanner. These radios are fixed channel units and do not scan. They can be powered form 117VAC or 12VDC with the proper mobile cord.

The audio quality on a Plectron P1 or 700 series is far better than any consumer grade scanner and the sensitivity and intermod immunity is outstanding if aligned properly. Better image rejection than most scanners (see article by Bob Parnass in Monitoring Times, January 1996 for comparison). The Plectron 500 series is less desirable. The Motorola Alert monitors are pretty good, although the audio lacks bass.

No single Plectron or Motorola Alert monitor can cover the entire 30-50 MHz band, and there were versions optimized for each portion of the band. There were different "split" models to cover segments of VHF-hi band, too. Although UHF versions were made, they are somewhat rare.

Both brands of receiver require special crystals. I sometimes use Radio Shack's generic 3rd overtone scanner crystals in the Plectrons but they oscillate on frequencies far away from their marked frequencies. That's because the Plectron oscillator is designed to be used with a crystal which oscillates on its fundamental, not overtone, frequency. Too, the P1 and R700 require different crystals.

If you find the squelch on your Plectron 700 series receiver has too much hysteresis, replace R96, a 180K resistor, with a 560K resistor. On the P1, the resistor is designated R81.

Repair service for the Plectron P1 and R700 models is offered by:

Woodson Electronics
Plectron Place
P.O. Box 960
Imboden, Arkansas 72434

telephone 1-(501)869-7985

Some replacement parts are currently available from Federal Signal in University Park, IL, phone (800)524-3021. For more information, see "Add a Crystal Receiver to Your Arsenal," by Bob Parnass, January 1996 Monitoring Times.

Custom Color Map & Report
of Transmitter Sites Near You

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)

dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping
and handling. For an additional $4.00, I will include a
custom frequency allocation histogram, a 0 - 1,000 MHz
"spectrum analyzer-like" display showing spectrum usage by
the transmitters in the map coverage area. Send check or
money order payable to Bob Parnass for $25.95 for standard
or $29.95 for deluxe RadioMap report with histogram.
Include your name, address, and telephone number, along with
center location (nearest intersection of 2 streets, or
latitude & longitude) and mail to: Bob Parnass, 2350 Douglas
Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central
time. For a brochure, send SASE.

: I STILL haven't received my COD from the United Parcel Dis-Service.

I had a similar problem. Sent a COD package and the driver neglected to collect the COD... :(When I called looking for it UPS said that they had no record of a COD shipment from me. Fortunately I hadn't tossed the UPS shipping receipt! Took me over a month to get the whole things straightened out. What made it move along was that I carried the forms to start small claims action against UPS when I went to their office.

I just wasn't in the mood to be included in the queue of other dissatisfied customers waiting for their money! When I asked for the managers name during our conversation at their counter and he asked what form I was filling out he seemed more than happy to expedite my claim rather than receive a subpoena from the court of small claims!

4003. Lancaster County, PA new dispatch?

Newsgroup: rec.radio.scanner
Date: 1996-11-14 00:00:00 UTC
From: georgef@prolog.net
Message-ID: <56e8jm$cbv@news.ptd.net>
Source record: 217709

Question:

Did Lancaster Country, PA get a new county police dispatch frequency? For the past few days I've notice that there has been only about 1/5 the normal traffic on the 155.505MHz frequncy. This freq. is North East Dispatch Freq for Lancaster Co. But example today I don't think I've heard a single 'Traffic Stop' and that is unheard of especially in Ephrata, PA.

If there are any Lancaster Co. Listeners out there please leave me know.

Thanks,
George

Kilgore asks: <>

Well, I bought one in August and compared to the BC-890 I was using prior, I love it. It is a huge improvement over the 890 and from what I hear it is also a huge improvement over the 8500. However, in some cases it is still subject to some degree of Intermod, but it is much less then the 890. I also love the alpha-numeric capability.
I also like it's simplicity. There are those who say to me that I should have gone for a unit that can be computer controlled by an Opto board. Well, I use it in a bedroom, and hooking up a computer just isn't practical for me.
Now, if I were you.... I would hold off till the new year and see if this Bearcat Trunk Following scanner becomes a reality.

4005. Triple conversion

>any message, understand it then go on.

I read the message and understand it and go on too. But I think slightly less of the person who wrote it since they did not bother to take the simple steps to correct blatant spelling errors. Or, perhaps have too big an ego to let a spell checker do it for them.

>
>You say "go ahead and let the whole world know how stupid and ignorant you
are
>by bad spelling? No no.

That was not a quote by me, but I do agree with it.

> What bothers "you" about it? Whats the real problem you
>have?

What bothers me is that since spelling comes extremely easy to me I cannot figure out why someone would let theirs go to pot. If there's a weed, pull it. Don't just let it sit there.

> Writing is communication.

But the communication breaks down when the writing sucks. Most of us are accustomed to reading "average" written communication. I am personally distracted when I read something that was poorly proofread. I click into some sort of zombie robotic proofreading mode and spend time scanning the material for spelling errors. Yes, I'm one of those annoying buttheads who CRAVES correcting other's incorrect use of the language. To me it's like squeezing zits. OOOOOH - found another spelling error. Zap.

>If a message is communicated then quit obsessing
>about the details.

I place a high value on well-written communication, just as others place a high value on, let's say, quality of collectible baseball cards (which personally do not interest me). You KNOW that baseball card collectors obsess about details regarding cards and trading.

> Do you go berserk when you go to someone's home and see pictures
>out of alignment?

Well, yes actually. I straighten the picture while they are standing there. My father in law purposely leaves ALL of the pictures in his office slightly askew, for the sole purpose of subconsciously disturbing people who come to his office for a meeting. He says it gives him an edge. I think it's hilarious (although I personally cannot stand crooked pictures). I also CANNOT STAND twisted telephone cords.

> Do you hate it when people wear different colored socks?

Watch it. I wear different colored socks. On purpose.

>
>With so many legitimate things to worry about in this world it baffles me why
>people become so obsessed with spelling of the english language. What a boring existence
>it must be for them.

If you are an excellent artist, then it probably would bug you a lot when you see a poorly executed painting. I consider myself an excellent speller, and it really torques me when I see printed or electronically transmitted matter littered with bad spelling.

>
>Chad

The simple fact is that a message with lots of spelling errors has, in my opinion, less credibility. It's like listening to someone who mispronounces words regularly. They simply come off as sounding less credible to me. It's important to me to produce reasonably cogent documents with few (or hopefully no) spelling errors just as I make the effort to correctly pronounce the words I say.

I agree that it is unfortunate for some people who cannot spell well or cannot pronounce words properly. They may be very intelligent people, but for some reason their writing and/or speaking comes off with less polish than it could, as opposed to applying their smarts to the manner in which they communicate in written and oral form.

The fact is, everyone misspells stuff. I probably made spelling typos in this email, and I don't worry about them because I know there probably is only one or two. It's the misspelled word I see every sentence that frosts my shorts.

Yours in proper speling,

Mike

Introduction to Scanning
by Bob Parnass, AJ9S

[NOTES: This article may not be reproduced in whole or in part on CDROMS, in bulletin boards, networks, or publications which charge for service without permission of the author. It is posted twice monthly on the USENET groups rec.radio.scanner, alt.radio.scanner, and rec.radio.info. It is also available electronically from the rec.radio.scanner ftp archive on the official USENET FAQ library ftp://rtfm.mit.edu/pub/usenet-by-group/rec.radio.scanner.]

This introduction is intended for people new to the scanning hobby and is oriented to scanning in the USA. It tells where you can buy your first scanner, what features it should have, where to get it repaired if required, how to get frequency information, and mentions a few scanner clubs worth joining.

The author writes a monthly "Scanner Equipment" column for Monitoring Times magazine, published by Grove Enterprises, but views expressed in this article are his own.

Why Scanning?

Every day and night, scanner hobbyists are entertained by what they overhear on their radios. Police cars, fire engines, ambulances, airplanes, armored cars, trains, taxis, and buses are all equipped with radios and you can listen to them. You can monitor the local sheriff and fire departments to hear about events "as they happen," before the news reporters hear about them. Hostage dramas, bank robberies, car crashes, chemical spills, neighbor and domestic disputes, tornado sightings are all fair game. In a single afternoon, you can hear a high speed police chase, Drug Enforcement agents on a sting operation, and undercover FBI agents as they stakeout a suspect.

How about listening to a presidential candidate discuss strategy with his advisor from a 415 MHz radiophone in Air

Force 1, or a team of G-men protect him while transmitting in the 167 MHz range?

Baby monitor intercoms are actually transmitters and you can hear them between 49.67 and 49.99 MHz.

Stay ahead of road conditions by listening to highway road crews, snow plows, and traffic helicopter pilots. Many midwesterners monitor the state police and and county sheriff to learn of approaching tornados long before warnings are broadcast on TV and commercial radio. Take your scanner to sporting events and listen to race car drivers, football coaches, etc., in the 151, 154, and 468 MHz ranges.

Monitor the everyday hustle and bustle of businesses, from cable TV repair crews tracking down pirate descrambler boxes, to security guards at your nuclear power plant or mall security guards chasing a shoplifter.

Is Scanning Legal?

In the United States, scanning from your home or at work is perfectly legal in most situations. The Electronic Communications Privacy Act of 1986 made it illegal to listen to mobile phones, common carrier paging, and a few other types of communication. Public law 103-414, signed Oct. 25, 1994, amended the law (Title 18 USC, Part I, chapter 119, sections 25110 and 2511) and outlaws listening to cordless phones, too, but many scanners cover these frequencies, and it's clear that Americans still listen to whatever they want in the privacy of their own homes despite the laws.

It is now illegal for companies to sell recently manufactured scanners which cover or can be easily modified to cover the cellular phone frequencies, but sales by private individuals will still be allowed.

Speaking of privacy, federal law also requires you to keep what you hear to yourself and not use the information you hear on your scanner for personal gain.

Be aware that several states have laws pertaining to scanning while in your car. Indiana restricts some portable scanners. A few states have enacted their own laws against listening to cordless phones. You can find out about these restrictions in a paperback book, Listeners Lawbook, compiled by Frank Terranella, Esq. available for $9.95 + shipping from Grove Enterprises, PO Box 98, Brasstown, NC 28902.

What Scanner Should I Buy?

Radio Shack and Uniden (maker of Bearcat, Regency, and Cobra brands) offer a wide choice of scanners. Radio Shack scanners are actually manufactured by both GRE (General Research Electronics) and by Uniden. Personally, I don't recommend Trident nor many of the AOR brand scanners, although the AR8000 and AR3000 have good reputations.

Programmable (synthesized) units have replaced crystal controlled models as they don't require crystals and usually have a keypad that permits you to store frequencies into channels. Programmables are now so cheap it doesn't make sense to buy a crystal unit as your main scanner unless you get it for under $45 or so.

You can get a battery operated hand held scanner, a bigger "base" scanner which is powered from an AC outlet, or a mobile scanner which connects to your auto's electrical system. There are tradeoffs -- base and mobile scanners have larger displays and almost always provide more audio than portables, and some portables are more prone to interference when connected to outdoor antennas than base models. But when severe weather knocks out the power in your home, there's nothing like having a battery operated scanner to monitor the power utility and police frequencies!

Make sure your first scanner:

1. has a "search" feature, which allows it to search all the frequencies between two frequency limits of your choosing. The lowest cost programmables can't search.
2. covers the 800 MHz band. Usage of the 800 - 950 MHz band is growing fast and you will miss out on the action unless your scanner covers this band.

If you're not sure whether you'll like scanning, don't want to spend much money, a 40 channel radio will do. In general, the more channels and banks, the better.

Most of the action takes place on frequencies between 30 and 1000 MHz, so don't be misled by scanner models boasting coverage from 3 to 2000 MHz. There's currently not much to monitor in the 1000 - 2000 MHz range.

If you are interested in receiving short wave, that is, signals in the 3 - 30 MHz range, it's best to get a short wave radio specifically designed for that purpose. Although some scanners receive the short wave band, their performance in that range is often second rate.

Deluxe scanners can be controlled and/or downloaded by a personal computer, a feature which appeals to a small but growing number of scanner owners.

Almost all low and mid-priced scanners are prone to receiving images -- receiving the same signal erroneously on two or more frequencies. With a few exceptions, images are unwelcome due to the interference they cause, e.g., hearing aircraft transmissions while the scanner is tuned to the local police frequency. Premium quality scanners use "up conversion" circuitry, a scheme which greatly reduces, but does not eliminate, image reception.

Currently, the more popular scanners include the Uniden/Bearcat BC760XLT (a/k/a 950XLT) and discontinued Radio Shack PRO-2006 base/mobiles, the Uniden/Bearcat BC200XLT (a/k/a BC205XLT), BC220XLT, and Radio Shack PRO-43 portables. A number of owners report problems with the Icom R1 portable and the older Uniden/Bearcat 8500XLT base and 2500XLT portable. The new Uniden BC9000XLT base and BC3000XLT portable work very well and are my current favorites.

Considered by many as the best scanner ever made, the 400 channel Radio Shack PRO-2006 was replaced by the 1000 channel PRO-2035, which was replaced by the PRO-2042. The portable Radio Shack PRO-62 and PRO-60 are good performers. All five models employ up conversion and are made for Radio Shack by GRE (General Research Electronics).

Scanner Antennas

All scanners come with a built in antenna, permitting reception up to about 20 miles or so.

Portable scanners are supplied with a helical (spring shaped) antenna, covered by rubber. The rubberized antennas furnished with current models are too stiff and place stress on the antenna jack. Older scanners to be supplied with more flexible antennas. I prefer to replace the stock antenna with an Icom FA-1433B dual band flex antenna which is thin and very flexible while providing better performance than a stock antenna.

Although it is small and somewhat tolerant of physical abuse, the range of a heliflex antenna is very limited. Augmenting it with a 19" telescoping metal antenna can improve portable reception greatly.

Since 1988, I've used the "Thin-Stick" 18 inch telescoping antenna for extended range on my portable scanners and 2 meter walkie-talkies. The Thin-Stick, made in USA by Smiley Antenna Co., Inc., is designed to cover both the 2 meter and 220 MHz bands, but its variable length means it can be adjusted for optimum performance on other bands. What makes the Thin-Stick different from an ordinary telescoping antenna is the spring between the antenna and

the connector portions. The spring absorbs most of the impact if the antenna collides with an object. The street price is about $17 and it is available from Amateur Electronic Supply, Milwaukee and other retailers.

Outdoor antennas, like the Channel Master 5094A or Antenna Specialists AV-801 (recently discontinued), can extend reliable reception to 100 miles or more. If you do use an outdoor antenna, be sure to disconnect and ground it during storms and when not in use to avoid a lightning hazard. Discone and ground plane type antennas can be more prone to cause scanner damage due to static charge buildup because they are not at "DC ground."

Coaxial Cable Feedlines

If your antenna installation requires more than 50 feet of feedline, use RG213/U or high quality RG8/U coaxial cable. RG213/U has a non-contaminating jacket and will last longer. Each has an outer diameter of about 13/32". Similarly sized Belden 9913 cable and clones have lower attenuation but are difficult to bend, require special connectors, and can accumulate moisture inside because they are hollow.

If you must use a small diameter cable for long runs, use RG6/U. Avoid RG58/U (7/32" OD) due to its losses at high frequencies. RG8/X (1/4" OD) is suitable for short patch cords.

Where Can I Buy A Scanner?

Almost every community has at least one Radio Shack store, and you can find scanners there. Discount chain stores like Wal-Mart, K-Mart, Service Merchandise, and Circuit City sell scanners, but carry just a few models. Department stores, like Sears Roebuck and Montgomery Wards, sometimes offer low end scanners, although at high prices.

The best buys on new scanners are from reputable mail order radio dealers, for example:

- Grove Enterprises, 300 S. Highway 64 West, Brasstown, NC 28902. For a free catalog, call (704)837-9200. Telephone (orders only): (800)438-8155. Web page is http://www.grove.net

- National Electronics (formerly National Tower Company), PO Box 15417, Shawnee Mission, KS 66215. Telephone (800)762-5049, (913)888-8864. Web page is http://www.sound.net/~ne/

- The Ham Station, 220 N. Fulton Ave., Evansville, IN 47719-0522. Telephone (800)729-4373, (812)422-0231.

- Scanner World (Albany, NY). Telephone (518)436-9606.

- Amateur Electronics Supply (Milwaukee, WI). Telephone (800)558-0411.

Beware of inflated "shipping and handling" charges and be sure to include these when comparison shopping.

Used scanners may be found at hamfests, flea markets, garage sales, or listed in the classified advertisement section of your newspaper.

Modifying Your Scanner

The term "mod" is often used as shorthand for "modification." If you are handy with a soldering iron, you may be interested in modifying ("modding") your scanner to add features or enhance its performance. Be warned this usually voids your warranty and current models are difficult to service due to the small, delicate surface mount components. By federal regulation, new scanner models cannot be easily modified to tune the cellular phone bands.

The term "mod" has been narrowly used by some people to mean a change which permits a scanner to receive cellular phone frequencies. This definition is far too restrictive as there are several ways one could modify a scanner, e.g., changes to improve audio quality, adding an S-meter, expanding the number of channels, changing the earphone jack to accept stereo headphones, etc.

Modification article files can be copied from several ftp sites including the /pub/ham-radio/mods directory at:

garfield.catt.ncsu.edu
oak.oakland.edu (IP address 141.210.10.117)

KD4MOJ maintains a scanner modification server for people without FTP access. You can request a list of scanner modifications by sending electronic mail with the words GET INDEX.TXT to FTPmail@exchange.tlh.fl.us

If you cannot find files describing modifications to a particular scanner, it's probably because nobody bothered to devise a modification, or more likely, nobody has taken the time to document their modification.

Modification articles posted on Usenet seem to have a life of their own. Frequently, they are plagiarized from the Internet and compiled by book, CDROM, and magazine publishers, sometimes reworded, then sold. Hobbyists then

copy the modifications from the books, CDROMs, and magazines back onto the Internet or BBSs (bulletin board systems)!

Grove Enterprises and other companies advertise a warranted, modification for fee service.

Scanner Repair Shops

Is your scanner broken? Aside from sending the scanner back to the manufacturer for repair, here is one company which repairs scanners:

- G & G Communications (telephone 716-768-8151) - (http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or ggcomm@aol.com) This family owned company repairs scanners and pagers and stocks parts for several older models. G & G cannot usually repair AOR scanners due to lack of manufacturer support. G & G sells and sometimes buys old scanners and parts, too. They are located at 9247 Glenwood Drive, LeRoy, NY 14482.

Where Can I Obtain Frequency Information?

To avoid chaos, the FCC licenses two-way radio users and assigns them specific frequencies. Groups of frequencies are allocated to specific types of users, so you won't usually find fire departments using the same frequencies as taxi drivers, for example.

Scanner enthusiasts can obtain frequency information from several sources, including books, government microfiche records, or other listeners.

Books: The most convenient source of fire, police, and local government frequencies is Gene Hughes' Police Call, published each year in 9 regional volumes by Hollins Radio Data, and sold at Radio Shack and larger book stores. The 1996 editions contain selected business listings, too, although callsigns are listed only for local government and public safety licensees.

I also recommend the book, Monitor America, published by SMB Publishing (now known as Scanner Master Publishing), and available from Grove Enterprises for about $30. A new, 1100 page 3rd edition is now available. Monitor America contains several pages of police, fire, local government, news media, sports, federal government, and commercial broadcast frequencies for all 50 states. It contains detailed communications system profiles and precinct maps for major metropolitan areas. Police and fire radio codes and unit identifiers unique to local agencies are listed for several cities. This differs from Police Call, which

gives a more sterile, but uniform treatment of licensees, listing even the smallest of towns.

Uniden has published several regional directories using the "Betty Bearcat" name, although there are much better directories available from Scanner Master (Newton Highlands, MA, tel. (508)655-6300) for some regions.

The most readily available source of sensitive US government frequencies is still Tom Kneitel's Top Secret Registry of US Government Radio Frequencies. Published by CRB Research, the 8th edition is available from Grove Enterprises for about $22. Kneitel's book contains frequency listings for NASA, military, FBI, Secret Service, DEA, IRS, Border Patrol, arsenals, ammunition plants, missile sites, and others in the 25 to 470 MHz range.

Tab Books Master Frequency File, first edition, written by James Tunnell and Robert Kelty, lists federal agencies and frequencies and deserves a read. However, there are no military listings and many pages are devoted to appendices and references which contain no frequency listings. The space would be much better used by a combined federal frequency list sorted by frequency.

Commercial Magazines: Although national in circulation, local frequency information is sometimes available in Grove's Monitoring Times (tel. 704-837-9200) and the sensationalistic Popular Communications, (tel. 516-681-2922). National Scanning Report is a national scanner magazine published bimonthly and is affiliated with Uniden's Bearcat Radio Club. Early issues disappointed experienced scanner hobbyists, but it now has a good column on scanner modifications and has greatly improved its coverage of east coast frequencies since merging with NESN (North East Scanner News). The best scanner frequency lists are often found in club publications, not commercial magazines, and are discussed later.

The Scanner Club is the name of a bimonthly magazine published by Les Mattson. It is a successor to the Northeast Scanning News and is the official publication of The Scanner Club, a not-for-profit club organization. TSC's main strength is local frequency information, including CTCSS codes. Sample issues are $4 each. A yearly membership costs $24.95 and includes 6 issues. Write to The Scanner Club, PO Box 62, Gibbstown, NJ 08027 for more information.

Government Records: Every year, the US Government sells FCC license information, in the form of microfiche, floppy disk, and magnetic tape, to the public through the US

Department of Commerce National Technical Information Service (NTIS). The high cost of buying government records limits their appeal to hardcore enthusiasts. You can write for a catalog of FCC Master Frequency Database items to the NTIS, 5285 Port Royal Road, Springfield, VA 22161.

The FCC has an agreement with PerCon (tel. 716-386-6015), a private company, to sell FCC license information to the public on CDROMs. You can buy the full license information for a multi state region or a less detailed license database covering the the entire USA on CDROM for about $100. The PerCon Spectrum CDROM sells for $29 and contains a handful of fields for every FCC license in the US. The Spring 1995 edition works in DOS, Windows, and Mac environments.

Grove enterprises sells FCC license information on CDROM for $100. In the 1995 edition, fields are different than PerCon's Spectrum CDROM but the data appears to be of the same vintage. The licensee name and licensee city are used instead of the DBA (doing business as) name and transmitter city which makes query results confusing.

As I have already done for hundreds of radio enthusiasts, companies, government agencies, and organizations across the country, I will locate FCC licensed and selected FAA and CAP transmitter sites in an area of your choice, in any state, and produce a custom RadioMap(TM) report, including an 8-1/2" by 11" scaled color map, protected by plastic. The map is marked with transmitter sites, cities, highways, airports, military installations, national parks, etc.

The graphical nature of RadioMap allows you to identify antenna sites and visualize the transmitter locations in your neighborhood, near your office, and other places of interest -- from VLF through microwave. The report lists frequencies, callsigns, and licensee names. RadioMap covers police, fire, local government, TV, business, industry, common carrier, railroad, trucking, and many more types of transmitter sites, excluding ham radio stations. Wireline and nonwireline cellular phone and AM/FM broadcast transmitter sites are clearly marked using unique color icons.

Industrial customers use RadioMap reports to survey the "radio environment" prior to installation of radios and wireless microphones at customer sites. RadioMap is used by the maritime and broadcast industries, as well as ham radio operators to solve intermod interference problems, and has been very favorably reviewed in RCMA Scanner Journal, American Scannergram, and USSN.

The RadioMap processes and software are unique and proprietary. Unlike "more tame" maps, RadioMap shows the locations of military bases, ammunition plants, arsenals, weapons factories, and other military installations.

For a flat fee, you choose the center location, and I choose the range, depending on transmitter site density:

suburbs: 5 mile range (100 sq. mi. area)
rural areas: 10 or more miles (400 sq. mi. area)
dense urban area: 1 - 2 mile range

Longer ranges for additional charge - call for pricing.

A custom RadioMap report costs $20.95 plus $5.00 shipping and handling. For an additional $4.00, I will include a custom frequency allocation histogram, a 0 - 1,000 MHz "spectrum analyzer-like" display showing spectrum usage by the transmitters in the map coverage area. Send check or money order payable to Bob Parnass for $25.95 for standard or $29.95 for deluxe RadioMap report with histogram. Include your name, address, and telephone number, along with center location (nearest intersection of 2 streets, or latitude & longitude) and mail to: Bob Parnass, 2350 Douglas Road, Oswego, IL 60543. tel. (630)554-3839 6-10 PM central time. For a brochure, send SASE.

Do Your Own Frequency Detective Work

When you try listening to a frequency for the first time, you'll want to know who you're hearing.

Although FCC rules require radio systems to identify their operations with their assigned call letters either automatically or verbally, most ignore the regulation. This often makes it difficult to know who is transmitting. Moreover, many radios are now being placed in service illegally, without first obtaining the required FCC license.

There is a challenge in deriving new spectrum usage information on your own. Sometimes it requires several days of listening, taping, and compiling fragments of information. Other times, the frequency information is there for the taking - without hassle.

You can approach from two directions:

1. Listen first: Monitor a frequency or frequencies, and try to determine who's transmitting and what purpose the channel serves. Once you identify the user, log the information.

2. Compile first: Take advantage of opportunities, such as examining the frequency label on a guard's radio,

or reading the FCC license hanging on the "radio room" wall, to compile frequency lists, then monitor the listed frequencies to confirm that they are really in use. Readers are urged to abide by the rules of good taste and local laws in the quest for frequency information. Don't trespass, wait for an invitation.

Most listeners use a combination of both approaches.

You can examine the FCC license on premise. I have found the actual FCC radio license, complete with frequency assignments, hanging on the walls of places like the mall security office or company guard shack. You can examine the labels on radio equipment. Frequency information is engraved on labels on the back of many walkie-talkies, or inside the battery compartment, like in the Motorola HT220 model. Most pagers have labels on the bottom or inside. Like passwords taped onto terminals, it's not uncommon to find labels embossed with frequencies or call letters glued to the front of base stations.

You can make your own opportunities for eyeing the equipment or take advantage of "open house" events. If information is displayed publicly, then a reasonable person could assume it's not government secret. Hobbyists are urged to exercise a modicum of restraint and good judgement, however.

How Can I Use Equipment
to Uncover New Frequencies?

If you don't know the exact frequency, but have a general idea of the range (e.g. 150 - 152 MHz), use your scanner's "search" mode. Most programmable scanners afford the ability to search between two frequency limits set by the user. A few models, like the ICOM R7000/R7100, and R1, and older Bearcat 250 and Regency K500, have the ability to automatically store active frequencies found during an unattended search operation.

To find the frequency of a hotel communications system, one fellow installed his Bearcat 250 in his car and parked in the hotel lot, leaving the scanner in the "search and store" mode. He left the antenna disconnected so the scanner would only respond to a transmitter in the immediate vicinity.

Aside from a scanner and antenna, the most useful piece of equipment for sleuthing is a voice actuated (VOX) cassette tape recorder. You don't need a high fidelity model or anything fancy, a Radio Shack CTR-82 will do. It's best to

use a shielded, attenuating cable to feed the scanner audio into the recorder rather than relying on the recorder's internal microphone.

VOX recorders allow one to compress a whole day's worth of monitoring onto a single tape. I often leave a recorder "armed" and connected to a scanner at home while I am at the office or doing something else. When call letters are mumbled, I can play and replay the tape until I hear and understand them.

Test equipment can aid in the quest for new frequency information. I've used a spectrum analyzer connected to an outside antenna, and a frequency counter for close-in work.

Are There Any Scanner Clubs or Mailing List?

One of the best parts of the hobby is sharing it with other radio buffs. Trading information with other hobbyists about frequencies, communication systems, and receiving equipment is more valuable than any pile of magazines.

Peter Laws administers an electronic mail list read by over 700 hobbyists devoted to scanners and scanning. It's called "scan-l" and for more information, read:

http://www.excalibur.net/~plaws/scan/scan-l.txt

Clay Irving <clay@panix.com> administers a scanner electronic mailing list, called "scanning." To subscribe, send an Email message to: majordomo@lists.panix.com

In the body of the Email message, put: subscribe scanning

All Ohio Scanner Club

A smaller club is the All Ohio Scanner Club. Its bimonthly publication, The American Scannergram, is about 60 pages long. Although concentrating on Ohio and the Northeastern states, there is frequency information from other states, and plenty of good product reviews and scanning tips.

Annual dues are $18.50 and more information is available from:

Dave Marshall, Managing Editor
All Ohio Scanner Club,
50 Villa Road,
Springfield, OH 45503.

Chicago Area Radio Monitoring Association

The Chicago Area Radio Monitoring Association (CARMA) is the foremost club for scanner radio hobbyists in the northern Illinois area. CARMA was formed from the Chicago

chapter of the Radio Communications Monitoring Association (RCMA), and we have been meeting since the early 1980s.

Many CARMA members are active in ham radio and GMRS, but the club is devoted to scanning and scanners.

Meetings are held on Saturdays, many at area restaurants, about 6 times a year. Although lunch starts at noon, the meetings begin officially at 1 PM and often run until about 4 PM. You must purchase a lunch since we get the room for free. Meetings consist of a quick review of club business, sometimes a special presentation, and a "round table" discussion/question & answer session. Large quantities of information and frequency lists are often distributed in the form of free handouts. Members often sell radio equipment at the meetings, too.

In addition to regular meetings, there are two CARMA picnic/field days during which members meet at a park, erect antennas, eat, and operate scanners from battery power. CARMA members take organized tours of various communications facilities in the area.

Club meeting dates and times are published in the CARMA newsletter, published 6 times a year. A one year subscription is available by mailing a $15 check, payable to Kim Moran, to:

CARMA
P.O. Box 2681
Glenview, IL 60025

Some CARMA members participate on the CARMA computer bulletin board, run by Will Sperling. There is a $15 annual fee for the BBS. If you have a modem and terminal or computer, you can reach the CARMA BBS by calling (630)852-1292.

All meetings are held on Saturdays at locations announced in advance. Meetings are usually held at:

- the Destiny Restaurant, on Rand Road, in Des Plaines,

- Philly's in the shopping center at the corner Rt. 83 and 53rd St. in Willowbrook,

- The Great Escape, on Irving Park Road, Schiller Park

and at other restaurants.

The installation is relatively straight forward. The documentation could be a bit more precise but if you take it slow and read carefully before each step, you won't have any trouble. It took me about an hour and a half. I also installed the OS535 in a PRO2042. That took about the same amount of time. Documentation was better but you have to spend time nibbling out the metal plate on the back of the scanner, which takes at least 20 minutes to do it neatly.

I don't know of any scanner software for Win95 (I'm sure that something will be along soon). In the mean time, you have a handful of Windows options and several DOS options. The ones that seem to get mentioned most often here are Probe, ScanStar and ScanCat. There are a number of demo programs available (not for Probe, which is what I use and recommend, unfortunately). Try those and decide for yourself.

I wrote a computer-aided scanning FAQ a while back and the last time I checked you could find it at www.ultranet.com/~bellvill/scanner.html. I've been trying to find someone to update it for a while, and someone has finally agreed to do that. Once it's done, we'll post it here.

Announcing NEW Ham Radio.FAQ

This file started as a regular USENET posting called "rec.radio.amateur
.misc Frequently Asked Questions".

The evolving file was distributed far and wide thanks to passionate
contributors. The file was abandoned in 1994 and has been resurrected
now on the WWW for currency and convenience.

Ham Radio.FAQ contains 3 chapters and many, many links to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or soon-to-be Hams
that you know or share with them the URL to this site:

That's what I used and found that it made a significant difference. Before
spending $30-$35 on that antenna, I would first spring for the radio Shack
whip for $9 and see how that works.

>Anyone know where I can get one?

Do you mean the flat ribbon cable? If so:-

I can supply you a new one that is attached to one metre of high
grade, double screened computer cable that in turn is fitted to an
interface unit for the AR8000/27000. The interface has another metre
of the same cable that goes to the computer. (Seperate the radio &
computer by over 6 feet.)

I supply the low cost interfaces either as a ready built up unit or as
a home construct kit.

I ship to the US & Canada as well as Europe.

Email me if you want more info...

>I'm getting an AR8000 & i would like to know whether the AR8000's
>connector is a real RS232? or is it proprietary?

It is neither: The data is in rs232 format but at TTL levels that are
insufficient do drive ths compute's true RS232.

The AR8000 also expects to see the data in at TTL levels too.

>....... Could i "manufacture"
>a pc link with a SAC8000 cable & some good old knowhow?

I don't know the SAC8000 cable, but YES, it is possible to construct
an interface yourself, even with little or no prior knowledge or
electronics experience, see below.

>.... or is there an
>active circuit i'd have to build?<if so does anyone have it?>

Yes, does need an active circuit, but see below.

>i want a cheaper way to connect the AR8000 to my pc than the 130$
>Optoelectronics Link...

I do a low cost Interface unit for the AR8000/2700 radios. I supply it
either ready built & tested or as a home construction kit of parts
with everything supplied: apart from the small soldering iron
required.

The kit is a suitable project for a beginner to put together - Fully
detailed step-by-step instructions and detail drawings are included.

BTW: I supply the special Flat Ribbon Cable PRE-ASSEMBLED on a one
metre length of high grade double screened computer cable. Another
metre length of the same type of cable connects teh interface to the
computer.

I ship to the US & Canada as well as Europe and can accept personal US
dollar cheques (checks) (No plastic)

Prices INCLUDING delivery to USA/Canada by AIRMAIL and a small bank
charge for currency convertion, no other hidden costs!!!

Built up unit, fully tested = 75 US Dollars
Home construction kit = 50 US Dollars

Provoke, no. Just telling him to prove it.

Besides, you are a fine one to talk. Oh well. I haven't the time to argue with you. Also, it would help if you posted in a more timely manner. That particular missive was sent from here almost 4 days ago.

Source record: 217480

Hey folks,

I was at an airshow a few weeks ago and saw an AOR 3000A Scanner in the rear cockpit of a Grumman EA-6. This is the electronic warfare version of the A-6. It was built into the rear instrument panel of the plane. Has anyone seen these scanners in any other military aircraft?

Mark

Check out the BC 860 XLT, $150 from Scanner World. I've used the 850XLT
for several years now. The 860 scans/searches faster than the 850, and
has 100 channels instead of 50. However, it doesn't cover the military
air bands. For those you would step up to the 890 ($260). Scott.

I used to have all of them, but tossed them when I left town.

next time you are near an unattended cop car peek in at the dash, the most common ones are usually taped there.

they are not important codes. They are mostly action codes that let the dispatcher know what citation or action was taken on the call.

for example: C-18, 10-8 is a no cause for alarm, back in service if my memory serves me.

Glen-

Did you receive my email about trading your FT-50r for a 2006?

If you still have the radio I would like to trade as soon as

possible. I will pay shipping both ways if you like. I can send

the radio Monday FedEx and you will have it Tuesday and then just take

the return airbill and put on the radio and send it to me the same day.

You can call me during the day at the 800 number below. Please let me

know so I know what I am going to do with the 2006.

Thanks,

Now mind you, I don't willfully violate the law by listening to cellular radio frequencies, , , , But, , , IF I were going to do

this bad thing, I think that it would be a hard thing to do. You see, there are over 850 cellular frequencies to listen to. Bummer.

So, how would someone program a scanner for all of these frequencies? The answer is, of course, you wouldn't. Then what is the answer? Well, you could use, say, a pro-2006/optoscan-456 to search a band of frequencies to find out which exact frequencies are used MOST of the time, and then just program these freqs into your handheld. That is IF you were going to break the law, that is :-} Just a thought.

Regarding the following comments on UPS COD, I find it hard to believe
that the shipper did not obtain a shippers receipt showing the COD amount due.
This would protect you against mistakes on UPS's part. That is just plain
dumb.

I usually abstain from discussion in this group, but this time I just couldn't resist. I'm still waiting for a '3-day guaranteed' package sent on Nov. 8. My friend suggested a conspiracy theory surrounding their attempted takeover of 220-222 MHz. Apparently, anything that was described on a packing slip as 'Amateur Radio' gear during the battle was particularly crunched, folded, spindled, mutilated or otherwise delayed. You figure they'd be over it by now.

Coincidence or Conspiracy? - YOU BE THE JUDGE! -

(in the hope of turning this thread into something constructive, what are some GOOD companies to ship COD with?)

Well, GSM - Global Service Mobile - is the standard EU cellphone. That would make it a remarkably accurate statement except for having one of these phones on your person enroute to the US where they don't work is silly.

Or, you could buy an inexpensive scanner like the BC860 XLT, or any RS, which allegedly receives cellular in the form of "images". Although I would never break the law either, a friend of mine has the attitude that "people should keep their g**damn radio waves off my property if they don't want me listening". He thinks that since all other radio transmissions (ham, police, etc.) are made without any expectation they are private (unless scrambled), people who use radio transmitters called "cellular" or "cordless" telephones shouldn't have any greater rights. I reminded him that Congress disagrees.... He also wonders why those people don't have to have FCC licenses and call signs :-)

These are the famous "images" that dual conversion scanners "suffer" from. You will receive cell conversations about 21.4 MHz above there actual assignment. Gotta love dual conversion RS scanners. Go back and try your test on a RS-2035 (or current model) of triple conversion scanners, no cell calls! Images are usually a pain in the butt (unless they occur at 896-915 ;o).

A few others but can't comment on what;-) We had them on ships as well.
SOmetimes we couldn't afford a 3000A so we went with the 2005/6. They are
useful in that it's a cheap addition we can use to scan things we don't
want to bother with on the Military systems. BTW, most of the EA-6B's and
ships carry AOR 3000G's not A's. G=Government.

GS> but I am not sure.

The CHP (dress) enforcement uniform is tan, while the blue "uniform"
(coveralls or similar) is used by members who perform mechanical
inspections or conduct on-scene investigations of accidents. It
prevents grease, grass and other stains from soiling the dress
uniform seen by the public.

Nope. Actually you can pick them up but since each channel is split and
it's using GSM it's all digital (and even has low grade crypto). The US
law enforcement agencies weren't too hot on the idea of GSM because it's
a real pain in the ass to monitor. France I believe made the GSM co's
take the encryption out.

Most companies that sell cell phones have a device that hooks into your A/C vent or into your cig lighter that is intended to hold your cell phone in the same fashion. With so many cell phone shapes and sizes, I bet they have one your scanner will fit into.

Goog Luck!

Good point. A little extreme perhaps, but bears consideration. Probably a little off-topic, but maybe so is a discussion of appropriate radio transmitter use in scanning NGs. I guess a thread is what you make of it.

So where was the irony?

No kidding. Particularly in rural areas. Around here UPS delivers to more addresses than the US Postal Service. USPS seems to be trying to dump its rural parcel service on UPS. Latest Postal Service policy is "no parcel pickup from rural boxes." You must face a postal clerk with each parcel to "prove" (huh?) that you're not a terrorist bomber. My post office is 20mi away, and could be "consolidated" to a more distant location in the future. UPS will still pickup rural from incidental shippers if you call ahead.

FedEx and Airborne won't deliver here at all (if you're lucky they'll reship via UPS from their regional distribution center -- if not they will try to get you to accept delivery to another party in a town 75mi away or you can insist it be returned to the sender for reshipment by another carrier).

United Parcel Service is still far and away the fastest, cheapest, most convenient and dependable parcel delivery in my area. As big as the system is, it's amazing how much impact on quality of service the destination drivers seem to have. I have very little experience with their COD service so I *won't* champion on that specific point, but of course I have to travel the same 40mi round trip to buy a postal money order that I would to post my mail bomb.

Desmond,
Your kidding right? A UPS radio frequency conspiracy? They have millions invested in a seamless, nationawide, cellular data network (they were the first to do this). Why would they want a 220 mhz frequency network? Yes, they applied for licenses, but who hasn't. Do you think the people who sort, load, and deliver their packages give a rats ass. Besides the FCC doles out the frequencies buddy. They aren't going to get the bandwidth by breaking your scanner! Next time your UPS driver comes to your door ask him his opinion about the allocation of bandwidth between 220 - 220 mhz. He'll ask you what the hell your talking about. The conspiracy is in your head.

It sounds like you were looking at a double conversion receiver. These tend to have very poor image rejection (picking up one frequency on more than one place on the dial) and can pick up the "images" of the cell frequencies outside of the blocked range (I sometimes wonder if RS deliberately makes their scanners a little leaky just for that purpose). I originally bought an RS PRO-2040 but found its imaging problems a real nusance and ended up getting an AR8000.

Yep! The safest and fastest way for the sender to get payment is by U.S.P.S. Money Order _properly made out with name and address_. A personal check is OK, too, if the sender trusts you but I can see where the M.O. is a better guarantee. UPS can't do anything with it except forward as directed.

Recent notes suggest FedX is better, but I've not tried them because it's much more hassle for the sender, and sometimes for the recipient.

Call UPS and ask for the number for the ICC. I did this and someone
delivered
a check 2 days later. There are definite rules that govern interstate
carriers, and
they know it is not worth it to violate them.

Certain scanners are modified to receive the cellular frequencies, even though the 894 to 914 frequencies aren't cellular. On certain scanners, the cell calls lies either above or below the actual frequencies.

One buyer recently sent me a prepayment via FEDEX and enclosed a call slip for the radio, this way there was no guessing at shipping costs, no hassle to me other than picking up the phone and telling Fedex to come and get the box, if I hadn't missed the drop by 10 minutes I could have actually just handed the box to the guy who delivered the MO and call slip. First time I have encountered this, and it really is a very smart way to do business, as well as convenient. Fedex is more bucks, but I have had good luck with them and USPS on big ticket stuff that you want to get out intact and not lose it on the way. Unfortunately there is still no way to ensure that the buyer actually will take delivery on an item sent COD, that costs you money and the loss of the item from the marketplace until it returns home.

My experience with a double conversion scanner is that I could not listen to the local police department (800 Mhz) without cell phone calls interfering. I switched to a triple conversion (PRO-26) and this solved the problem.

> money. Suggestions?

You should probably get something that covers 800mhz. In my area most city and state departments have moved there. If you enjoy airshows, make sure you get somethings that covers the military bands (200-400mhz). (Fortunately I was able to trade my 3 mo. old scanner for one that covered the mil bands for only the difference in cost.) It may cost a little more but it would probably be worth it.

I know how important beer money is, but I also believe in getting something good enough so that I don't have to spend more later.

All should beware of a scam that's in vogue on FEDEX. It goes like this:
Someone orders something from you via e-mail (or fax). He asks you to send it FEDEX COD and send him (e-Mail) the tracking number, or he calls you back for the tracking number. He then calls FEDEX and asks them to hold the package at the local FEDEX customer counter (which they gladly do). He then goes to the customer counter, and since FEDEX will not take cash, gives them a fake certified check (printed on an ink jet printer). When you get the fake check and complain to FEDEX, they say:
"We had over 500 customers at the customer counter that day. We can not identify the person who gave us that check. Since no delivery attempt was ever made, we can not verify the address (which of course was fake). We are not responsible for someone giving us a fake check. You lose".
This scam can work several ways. If the bad guy has your zip code as well as the ship to zip code, he may be able to get FEDEX to track down the package without the actual tracking number. Same result. Or, the address is a phony drop, FEDEX leaves a notice, with the tracking number on it, of course, and you know the rest!
UPS is far from perfect, but I think safer, since you can specify cash only, which makes them at least somewhat liable if they take improper funds. An obvious fake, made on a photo copy machine or an inkjet printer would not be something they would want shown to a jury in court. And they do state that they are liable for the money if they fail to collect. For now, I feel safer with UPS!

Not on Radio Shack's shelf, they're not.
These are images; the scanners used are probably double conversion units.

You are getting images; a triple conversion scanner won't do this, but a
double conversion model will.

The scanners were probably picking up 'images' of cellular phone
calls. They probably were double conversion with 10.7MHz first IF, and
you would hear any signal again at 21.4MHz above where it is supposed to
be.

Help! I dropped my PRO-43 a little while ago. The scanner was still in the case when it hit the floor and it did work for a little while after I dropped it, but it just quit on me a few minutes ago. It was scanning normally when all of a sudden the display went blank without warning (no the batteries are not dead).

It acts like it's not getting power, so maybe that's a place to start. Any other suggestions on where to start? I don't have the PRO-43 service manual, but I think I'm going to be ordering one very soon...

THIS REALLY SUCKS.

Any help would be GREATLY APPRECIATED.

: I have a "Friend" who "doesn't listen" to "cell phone calls", and he
: has a question.
: There are about 1000 frequencies in the 800mhz range. How are calls
: handled when there are more that 1000 calls being made?

The calls won't go through after that, you'll get a "no service" light
come on, on the phone.

: Also, how large are the cells themselves. Several miles?

Depends on how populated the area is. In crowded cities, you might
travel thru several cells over the course of a mile. A cell in a rural
area might cover several miles. In cities, each cell (circular) is
usually divided into three sections like slices of a pie. You can spot
cell towers easily by their triangular tops.

: Is a call broadcast througout the country? How does it find "his"
: phone?

No, when someone turns on their phone, it sends its ESN (unique number).
The nearest cell tower receives it, and this information gets stored in
the land-based computers. When an incoming call is received, the
equipment routes the call thru the nearest cell tower. If someone leaves
their phone on it periodically transmits its ESN, and if needed, the
tower responsible for handling the call will change.

Pagers, on the other hand, are broadcast to everwhere in the country, if
the person is using a nationwide service. The paging system, unlike the
cellphones, has no way of knowing where a particular pager is at a given
moment.

You were listening to double conversion scanners. What you heard were
images of the actual frequencies from appoximately 874-894 Mhz in the
cellular bands. I bought a RS PRO 2036 (i.e. BC 890 XLT) and it does
the same thing.

I have both the Diamond RH-77CA and the $10 Radio Shack extendable metal
whip. The Diamond beats it hands down on every band except VHF-lo.
Even then it's not bad on VHF-lo.

Kalmbach Publishing (publishers of 'Model Railroader' and 'Trains'
magazines) puts out a railway frequency guide indexed by railroad and
geographic area. It should be available in any well stocked hobby
shop in your area catering to model railroaders. Just check your
yellow ages under 'hobby shops' for some & call them. As Jason points
out the frequency used is that of the 'host' railroad, some Amtrak
runs will travel over several different railroads in the course of a
run. The most traffic will be on the 'road' or 'dispatcher'
frequency. I belive the 'on board service' staff also have a
frequency of their own as opposed to the AAR frequencies used to
govern the running of the train. (Jason is right there too) Dont'
beleive the Amtrak train number in the public timetable is exactly the
same on the railroad (eg: on BNSF Amtrak # 7 & 8 the 'Empire Builder'
are referred to as #s 107 & 108 because 7 & 8 conflict with some BNSF
train numbers)

Most likely it was on purpose. It's illegal to import and sell
new cellular-capable scanners in the US (it _should_ be okay to sell used
units that were manufactured before the law went into effect though).

Not sure if it's easy to modify on a PRO-23 though.

I saw this in email (and replied) about a day before it
showed up here in the newsgroup.

For the benefit of anyone else who is curious:

The so-called "ham exemption" varies from state to state.
In NY, the wishful thinkers would like to believe that
possession of a ham license automatically entitles them to
use a mobile scanner. The law is not written that way, but
indicates an exemption for a licensed user of ham equipment
that incidentally receives signals outside the ham bands.

The real meaning of any law is determined by the courts, and
I have not yet found any case law determining exactly where
the "ham exemption" in NY begins or ends. Out on the
streets, not many hams are ticketed for having scanners, so
the hobbyist viewpoint seems to be shared by law enforcement
at the moment.

Well,

In fairness to UPS...it seems that i was a bit hasty, and that they
have me andmy records so screwed up that the check I received
yesterday is a check for another item I shipped OVER ONE MONTH AGO,
and thought I had been paid on.....

However, believe it or not, when you call UPS after receiving a COD check, THEY CANNOT TELL YOU WHAT SHIPMENT the check is from.
Can you believe it? They told me they would forward my request fro info to the "COD Department" and someone would call me within twenty four hours. Well..I;m still waiting for the call.....

The $355.00 is STILL outstanding, and the 10 business day period for the trace will be up on Monday. If the check isn;t here by Monday, I will raise holy hell with them, and I WILL start calling the ICC and everyone else.....I'm on vacation 'till the middle of December, and if nothing else. will aggravate the SHIT outta them to the tune of $355.00!

I'll even go down to the UPS customer service counter and raise hell.

Source record: 217432

I just wanted to describe my recent antenna experiences on my house. (Since so many here gave me advice<G>)

I tried the Radio Shack discone, and it wasn't too much better than my set-mounted Grove ANT-8 on low-band. I returned it and bought the "Grove Professional Discone" which is actually a Diamond Model 1300 discone.

The Diamond antenna is GREAT! First of all it's major material is stainless steel. The only aluminum on it are the long elements that hang down. The short radials, upright element,
and all of the center pieces are solid, stainless.

It works great on everything I've ever tried it on, from 33-920 MHz. They rate it for 25-1300, and
the base loaded center element really seems to make the lo-band happen.

This antenna ain't cheap ($89.99), but I highly recommend it.

Barry

No it does have intermod but I personally think it is not as bad as
people say. although it does have what is called Floating birdies.
it will sometimes generate it's own noise , more often in 800 Mhz

> * Is the shortwave/SSB feature useable?

at> Regards

I am not positive, but I believe that most of all the emergency situations in
and around Toronto switch to Cellular. This is based on the fact that both
Cantel and Bell's main cell bases have backup generators that hold their own
durning storms. Again, I am not positive, but I have experienced increased
cell use during storms out here in the Bowmanville-Oshawa area.

4102. FS: CRAIG (Pioneer) oldie

Newsgroup: rec.radio.scanner
Date: 1996-11-16 00:00:00 UTC
From: path@awod.com
Message-ID: <path-1611961533220001@chs0197.awod.com>
Source record: 217437

FINAL POSTING:
==========

I have had connetion problems after my original post early this month. So, if you sent Email and never heard from me, now is the time! I have also included a little more information learned since then. Thanks.

Craig (was a division of Pioneer)

ORIGINAL POSTING:
==========
Craig (Model 4354) mobile/base station receiver, circa early 1970s

Made by The Craig Corporation, Compton CA

...owner's manual

...twelve channels

...3-bands

...FM monitor scanner

...priority and weather channel monitoring

...program VHF High, Low, and UHF frequencies

...It is 'programmable' in that each channel requires (and has) a crystal. I have five additional crystals of different frequencies.

...It is selectable in that each channel has a SELECT, SCAN and BYPASS switch, except for Weather that is either on or off. There is one Priority channel.

...LoVHF 33-47 mhz

...HiVHF 152-160 mhz

...UHF 455-465 mhz

...There is a mobile mounting rack attached, but no other wires, etc.

...It has a telescopic antenna that is detachable. The manual says there were two, but I only have one.

...There is an AC power cord attached. The manual says there was a DC power cord, but I do not have it.

...On the front, there are POWER, SQUELCH and SCAN DELAY knobs.

...On the back, there are: AC and DC power plug-ins; external speaker plug-in; UHF and VHF plug-ins; it also says on a sticker: AC:120V.50/60Hz,11 Watts, DC:13.8V 5 Watts.

AD:
==
FOR SALE: Craig (Model 4354) mobile/base station receiver, circa early 1970s. With manual. Has twelve channels covering 3-bands: 33-47 mhz, 152-160 mhz, and 455-465 mhz. It is 'programmable' in that each channel requires (and has) a crystal. I have five additional crystals of different frequencies. With mobile mounting rack and detachable telescopic antenna. Uses 120VAC (50/60Hz), or 13.8VDC. Best Offer. Email:path@awod.com

FURTHER INFORMATION on other CRAIGS:
==========
The 4353 is dual conversion with IFs of 10.7 and 0.455 MHz.
Like other Craig models, there are separate trimmer capacitors
to net each crystal on frequency.

These are not broadband scanners. They are designed for best
sensitivity over an 8 MHz wide part of the VHF-high band
and 20 MHz wide part of the UHF band. They can be changed
only by changing parts in the front ends and realignment.
The VHF-low coverage is wider, and covers 30-50 MHz.

4530: Japanese 10 channel crystal controlled 3 band unit. Also available under Plectron name but in different cabinet. No aircraft band. Deluxe features like priority, trimmer capacitors for netting each channel, front panel speaker, and rugged metal cabinet make this unit a winner. Channel lockout slide switches have finite life. Replacing burned out incandescent channel lamps not fun. Grab a 4530 if you find one in good condition.

Pat

UPs HORROR TIME...really. Sounds like sales reps with USPS
a new job trying to convince us that UPS is lousy....have
been using UPS for millineum and what problems are not
known....they deliver.

get on your 800 operator and get the phone of DAMARK.
they have this 800 portable 50 channel scanner for
sale at a great price.....bearcat too.

they have a 30 day return....but it's only 50 channels.
but for the price with 800...i'm tempted. just need
an antennae more....

4106. The Saskatchewan Scanner Page

Newsgroup: rec.radio.scanner
Date: 1996-11-16 00:00:00 UTC
From: tkeyowski@dlcwest.com
Message-ID: <56lbra$fio@fin.firstnations.ca>
Source record: 217441

Greeting, everyone. I invite everyone who is interested to check out a new scanner page devoted to the scanning hobby. The Saskatchewan Scanner Page will concentrate on scanning in the Province of Saskatchewan and for bringing scanner enthusiasts in the province together to discuss scanning. It will be a location to contribute information anyone wishes to share with others and as a source of information for scannists, old and new and visitors to the province.

It is new and in it's infancy stage, so changes will be happening over the winter. Your contributions and suggestions are most welcome wherever you may be from. I may expand to listings for Alberta and Manitoba if interest is enough, but for now, I'll concentrate on Saskatchewan. So check it out and give me some feedback:

The Saskachewan Scanner Page:

http://www.dlcwest.com/~tkeyowski/scanner/mainpage.htm

That would be preferable to it being incapable of receiving anything! :)

I have a similar failure on my PRO-43 and have not yet sent it back
for repair. I'll give this reset procedure a try, but I have a
sneaking suspicion that it will not work. It seems like it is
not a rare failure mode, however.

I concur. The installation was straightforward, but you should read the
entire installation procedure before you sit down to perform it, just
to familiarize yourself with everything.

Otherwise, it fits like a glove, works like a champ.

Finding software that you like is another challenge altogether.
There is junk, mediocre stuff, and great stuff, but it's tough
to sort it all out.

Good luck.

If you keep tabs on aircraft and airports, go to your local thrift shop and look for books like these:

Pilots Guide to California airports, by Optima
or, Flight Guide airport & frequency manual, by airguide Publ

These very expensive books were intended for pilots to use for finding airports and the tower frequencies. They are usually outdated, but the frequencies are correct enough for the average scannist, and the price is right. I paid $5 and $2, for these gems at our local thrift shop.

If you need parts do what I did and order them from a radio shack warehouse in england or canada. They have parts that allow full 800 mhz reception.

> : There are about 1000 frequencies in the 800mhz range. How are
calls
^^^^

A-band and B-band cellular carriers in an area each get to 'play' with 416 channels out of 832 total channels allocated by the FCC. Of these 21 (22 in Dallas/ Fort Worth) are used for 'sig' or signalling channels - that leaves 395 channels for voice use (394 in DFW).

> : handled when there are more that 1000 calls being made?

Most three-sector cellular systems use what's called a 7/21 scheme for frequency allocation and reuse. This means that the first one through seven cell sites use different frequencies and the eighth cell site will re-use the "frequency group" of the first, the ninth cell site will reuse the 2nd cell site's frequency group and so on.

In the Dallas Fort Worth area with around 300 macrocells (each with three sectors) and 18 channels (limiting myself to analog only - no digital mixed in) available per sector this translates to a maximum of 16,200 possible phone conversations simultaneously - not just 416 (or 395).

The "21" refers to how the 'frequency groups' are formed and then these 'channels' are assigned to cell sites during system RF design. Since we're going to re-use frequencies after the 7th cell site and we're working with three sectored cell sites this means 21 unique "frequency groups" in a 7 cell cluster. A system us then 'stamped out' using this pattern usually using some high-dollar RF propagation tools and suitably compromising where necessary to make it all work.

>
> The calls won't go through after that, you'll get a "no service"
light
^^^^^^^^^^^^

Not correct - the No Service 'light' comes on in the absence of a selected provider (as set in the phone) such as A-only, B-only, A-preffered etc (it's all in the RS-553 TIA/EIA spec).

When a call won't go you'll get what we call a 'honker'.

Good for you!!! There is nothing worse that to have one of your babies sick or in the radio hospital. Have you tried the 800mhz or the Freeband Mod for this radio? I think the FREEBAND mod for this radio is called the Shortwave mod although it doesn't really give you much in the way of shortwave without another ant. or RF amp. but it does give you all of those empty spaces listed as not covered on the back of the radio. This mod does require you to have first perform the 800mhz mod though.

this
>is referring to a stolen vehicle but what is the difference between,
say,
>3-column and 5-column?
>
>Thanks in advance.

GO TO RS...and ask for the san fran police sheet...they sell them
on Geary Blvd or down on Market or the one on Taravel or distric.

district is spelled with a "t" at end.....ok.

the answers: the code 33 is on the RS sheet or in their book.
it means all cars clear the air and allow car
with an emergency to speak....only that car.
Just that the Richmond car works the richmond district and this
will be heard by those units on a PIC zone channel for their use
in that part of the city.

stolen cars are referred to the dailybulletin on certain columns

they carry six columns full of stolen cars....and that is what
they are referrring to...the daily sheet on the computer showing
the columns referred to.

Or they will get even more specific and say: it's on the daily
sheet in the 3 column...meaning that the first number of the
stolen plate begins with three.... or in the F column...the first
Lettered COLUMN begins with F..... FED321....plate....

again...go into RS with an attitude....I am your saviour...make
me happey AND YOU STAY out of poverty.....

RS people dream of the INternet quite a bit lately.

> the connector?

Oh definitely. That's happened with my BC-100XLT twice now, where I've had to go in and fix it. But in my case, this is because I'm constantly removing and replacing the rubber ducky for mobile seat use. So, that will do it, too. What happens is that as you remove and replace the rubber ducky, twisting it along those two locking pins, they slowly erode/wear, making a looser fitting each time. As it gets worse, the antenna sorta "limps" and it doesn't quite connect with the center anymore. Thus, when you move it back towards center again, the reception returns. Have a look, I'll bet that's what you'll see...eroded locking pins.

Also, I use the thing heavilly. Dropped it more times than I can count. The ducky is bent, so I always get comments on it, as you can imagine. :) Gotta replace that sometime. "LOOKS LIKE 'IS *NOSE*! 'AY, 'e's got a scanner that matches!" or "Don't worry, if the antenna gets broke, just stick yer nose in there an' it'll work!" :) You get the idea. 8-)

While you've got it open, you might as well remove the old BNC connector and replace it with a better one more likely to handle the stresses anyway. You'll still have to replace the BNC, but not as often as with the original, cheapo one that they often give you with the scanner when you purchase it.

Make sure it's well-seated BEFORE you solder or you won't be able to put the ducky back on, though. :) I've done that, too, while tired. :) And things (space) are kinda tight in my BC-100XLT.

Of course, if yer one of those who's about as good with a soldering gun as a cat is with a spoon at the dinner table...you might want to get a friend to do it for you. :)

Take care,

Todd

That was the other problem I had concurrently with the eroded bnc
connector with my BC-100XLT. Forgot about that.

> I also found that it helps to keep the locking ring on the BNC connector
> tight so the connector cannot move around and therefore allow the
> connections to the solder pads to move.

Be careful, though. That was the hard part...getting it to fit snug, but
it was often difficult to get it so that the antenna would be allowed to be
connected at all. Had to try a few times. They originally use these cheap
BNCs and when you try to fit in a better one...and they fit things in there
so tightly... Ugh!

Take care,

Todd

: This is the first move I've seen to block cordless. Are you
: sure? The 1997 catalog does not indicate any blocking of
: any frequency ranges beside cellular.

: Also, does Radio Shack make a Canadian version so those of
: us who listen to Canadian non-cordless-telephone
: transmissions in the 49 MHz band can continue to do so?

My PRO-66 allows monitoring of the 46-49 cordless band. This is a new
scanner in the 1997 catalog. Plus, none of the specs in the catalog
indicate any scanners there have that band blocked..

entered.

Since modern scanners are controlled by processors, the more likely senario would be that the processor would convert the users input to a binary value and compare the value against allowed frequencies. If the binary value passed the test the processor would then and only then write the value to the appropriate storage location. Otherwise the processor would discard the value. The actual memory location for the frequency would never even be accessed on invalid input.

> The most likely stumbling block is that the memory and processor are on
the
> same chip and the WRITE DATA line is not accessible.

Even if you could access the WRITE DATA line, the speeds involved (probably microseconds) would make it impossible to press a button in the time frame required even if you knew when it would occur (which is highly unlikely).

But each cell site has a "fixed" subset of the total available channels. Mapping out the channels in use in any particular area will slowly show which sites are using which freq "plan", significantly reducing the scanning burden, should one be so inclined....

I believe PCS technology uses the 1.9 to 2.2 GHz range. Hardly a scanner around that'll touch that and, yes, it is digital (read: very secure).

Just to reinforce my earlier comment, Ken (above) did it the right way.
He kept his shipping receipt. It was unfortunate that he had to resort to the
threat of legal action to get UPS to respond. This is not usually the case,
as many thousands of COD shippers will attest.

Railroads in the US operate in the VHF band 160.215 - 161.565 MHz. Outside of the Northeast Corridor, Amtrak uses the radio frequencies of the host railroad. The Compendium of American Railroad Radio Frequencies lists:

Lake Shore Limited
Buffalo, NY
to Selkirk,NY Conrail 160.800 Ch 1 Road
to New York,NY Conrail 160.980 Ch 4 Yard & Road

Silver Meteor / Silver Star
New York, NY
to Washington,DC Amtrak (NEC) 160.920 Road
(DC terminal area) Amtrak 160.290 Ch 1, 160.800 term. area road
to Richmond,VA RF&P (CSX) 161.550 Road & disp. (161.100 possible)
to Wilson,NC CSX 161.550 Road, 160.410 dispatcher
to Auburndale,FL CSX 160.590 Road, 161.520 dispatcher
to Miami,FL CSX 161.100 Road, 160.320 dispatcher

If you're taking the Silver Star, the stretch from Selma, NC to Raleigh may be on Norfolk-Southern: 160.950 Road, 160.245/160.830 disp/train.

Scott,
This could be a tough one as there isn't much to go on yet. The drop may or may not be related (you don't indicate what "a little while" is).
Even though the display is blank, are you still getting reception? What happens if you back the squelch all the way off? Without the display, you should still be able to punch up the NWS, do you get it?

If none of these produce results, try the hard reset (I'm presuming it has one, as the 34 does). If, after all that, you still don't have activety, it'll have to be opened. Unless you're set up with a digital probe and DMM at a minimum, there probably isn't much to be accomplished by opening it.

If you are, verify power supplies, then clocking. The crystal(s) should be easy to spot. Beyond that, it's schematic time.

Actually, the cheapest and quickest method is to disconnect your
antenna, and stick about a 2" piece of wire in the center pin of the
BNC. Run a search during peak time, roughly afternoon drive time, and
you'll get your "local" cell freqs quickly and painlessly. Keep in
mind you only want the ones that are 2-way conversations.

[Article crossposted from nd.radio]
[Author was John Murphy MH113 857-3027]
[Posted on 16 Nov 1996 00:35:03 GMT]

Hello all...
Some of you may know, others may not, but I have been asked to write a column for a magazine called The Scanner Club. It is a compendium of all 50 states and covers scanning in all areas and from all points of views. I cover the entire state of ND and need input from areas that I do not have access to personnally. I also have flyers that advertise The Scanner Club and wish to pass info along that is appropriate to all.

My first quest is to insure accuracy in all that I write. I want to cover all cities and counties etc. But, again, do not have info for some areas.

It would be very nice to get updated info for my frequency database so that when I cover a particluar area, I can be accurate. If anyone out there sends me info, I will certainly give credit to anyone who gives me info.

I would like ALL info, police, fire, medical, etc of course, but also amatuer, business, private security, users on itenirent freqs and so on.

If anyone would like to get a sample copy of my column, please email me and I will email back the most current one.

Thanks to all for any help!!!!!

Happy monitoring -- John

4145. Wacko Free Wilderness Society

Newsgroup: rec.radio.scanner
Date: 1996-11-16 00:00:00 UTC
From: pworrell@cris.com
Message-ID: <848127852.32680@dejanews.com>
Source record: 217647

We here at the Wacko Free Wilderness Society are submitting the first draft of our charter.

What we are about. We simply want the freedom to go out to the woods, camp, fish, hike, and do whatever else we want to do in the wilderness without running into environmentalist wackos.

We at WFWS are committed to a world, one day, where our children can cut down trees when and where they want, provided they own the land. We want a wilderness where you can use a cellular phone without having an environmentalist jump out from the bushes, stomp on your phone, and throw pigs blood on you, all the while repeatdly screaming "Murderer!" A wilderness where you can walk through the trees without running into a sign clad wacko chained to a tree singing "We Shall Overcome".

We have taken no action as of yet, and are not soliciting members at this time. We do not condone illegal activities such as sniping wackos. We have taken no legal action, but may be forced to some day.

If you have any more suggestions for the charter, please feel free to write.

I heard if you are a police offcer, medic (EMT), new media or a
liceinced amateur radio operator you can LEGALY have a scanner in your
car.....What do you know about this...I read it on someones site.

Watch out....if you send it in to radio shack and you have the one which
is cell capable, they will swap it and put in a unmodifiable one in!

I'm sure that with time, nearly all radio communications will switch to digital equipment.You can multiplex transmissions with them, so they use bandwith more efficiently, and they have the added benefit of being able to send text and pictures. Since it's just as easy to encrypt digital data as it is to send it "in the clear",I'm sure that ALL police,fire,cellphones,business radios,etc. will be encrypted, with an option of operating unencrypted on a common standard to talk with other systems. Scanning will become an extinct hobby...It's a long way off yet, but you can bet your last dollar that this is what the future holds.

Message-ID: <19961116083100.DAA10300@ladder01.news.aol.com>
Source record: 217653

From what I understand, the signal from the LoJack only transmits the ID number of the lojack unit.When the police pick up a signal,this number shows up on a screen,and they can call the dispatcher to find out what kind of car has that ID number, and it's license plate number. This way they know what they're looking for. They use a direction finder to home in on the car's general area, but it's not extra accurate. They just look for the car that fits the decription.

Lots of stuff gets "lifted" from UPS. There is little accountability. Once I shipped a night vision scope; the counter people refused to accept "optical equipment" as the description, they wanted to know EXACTLY what it was that I was shipping. So I reluctantly told them, but increased the declared value from wholesale to retail level. This was fortunate, as the package never made it out of that UPS office. During the claim process, I asked if the UPS security people were interested in any of this (since it was a rather large claim), but they were not in the least bit interested. So I expect the thefts will continue.

If you need security, I have heard to declare a value over $10k, which then requires special handling procedures. You won't collect more than the real value if the item is lost, but for the extra 30 or 35 bucks the chances of loss should be somewhat diminished...

4156. What does "3-car" mean, other newbie questions?

Newsgroup: rec.radio.scanner
Date: 1996-11-16 00:00:00 UTC
From: philbell@primenet.com
Message-ID: <philbell-1611960142340001@ip217.sfo.primenet.com>
Source record: 217658

I listen to police frequencies in San Francisco and would like to know what is meant when they say:

"# - car" such as "we have a Code 33, Richmond 3-car..."

and

"# - column" such as "add to the hot sheet in the 5-column". I know this is referring to a stolen vehicle but what is the difference between, say, 3-column and 5-column?

Thanks in advance.

4157. Which antenna for Uniden BCT-7?

Newsgroup: rec.radio.scanner
Date: 1996-11-16 00:00:00 UTC
From: philbell@primenet.com
Message-ID: <philbell-1611960154590001@ip217.sfo.primenet.com>
Source record: 217659

I'm interested in getting an antenna other than the one supplied with my new BCT-7. The Scanner Master catalog lists a Scanner/AM-FM Balanced Antenna Splitter which is quite appealing to me since it uses the radio antenna on the car and thus, I don't have to install anything else.

The catalog says the BCT-7 requires a separate adapter "available at most Radio Schack stores" to plug into the splitter.

Questions:

Does anybody have this splitter and using it with the BCT-7? If so, how well does it work?

P.S., I live in San Francisco if that has anything to do with what I'm trying to receive (l listen to local police primarily).

The other option I'm considering is getting the "Scan-Tenna" which is a full range through-the-glass mounted scanner antenna, a 22" co-linear whip. Is its performance going to be better than the option I discussed above? If so, will that improved performance be noticeable for my listening habits (local police in San Francisco, where I live)?

Thanks in advance.

4160. Wanted to buy: CHEAP SCANNER

Newsgroup: rec.radio.scanner
Date: 1996-11-16 00:00:00 UTC
From: char0011@maroon.tc.umn.edu
Message-ID: <char0011.848140878@maroon.tc.umn.edu>
Source record: 217662

OK: I FINALLY have some moolah together. Here is what I am looking for:

Requirements:

MUST be able to take good ol' Duracell/Energizer AA batteries.
NiMH capability is nice, but I want to be able to use normal batteries also

Must be able to pick up Police/Fire/EMS (altho 800 Mhz isn't necessary,
see about cellular below), aviation, racing, Wx, etc (is there a scanner
that can't pick up normal stuff?)

Brand name is not important. This is to tide me over til I can afford
the ar8K

What I am willing to pay:
Non-800 Mhz: $50-$75
800 Mhz but not easily cellular capable:$75-$100
Cellular capable: $100-$125

As for cellular, whether it's stock or modified, I don't care. If the
unit is capable of being modified, but isn't modified, the mod must be
simple, like clipping a resistor. I'm not an electronics tech.

Obviously I'm looking for bottom of the barrel...I want to be able to
hear cops and such, and cellular would be nice, but not a must-have.

I will ONLY do business thru COD (preferrably NOT UPS...I've been reading
the horror stories). I live in Minneapolis, MN.

email me at char0011@maroon.tc.umn.edu if you have something you want to
get rid of. I try to check my email at least once a day.

Thanks in advance,
-Bill

clopez0407@aol.com wrote:
>
> Can anyone review the Trident TR 2400 scanner?

I had one of the earlier models that still had the cell frequencies unblocked. I was VERY happy to get rid of it. It had birdies everywhere, and scanning was horrible. I really do not think it's worth the $450 price tag. I traded it in on an AR8000 and was very happy I did.
I think putting the money toward the AR8000 is a much better plan. You will have all the flexibility of the claimed specs of the TR-2400 and will have a much better radio.
BTW, the reason I got the unit in the first place was because ACE communications substituted it for an AR1500 that I ordered!

Cross-posted to: rec.radio.scanner,alt.radio.scanner

I'm finally in the position to purchase a high-end handheld. My
interests are public service bands, aviation, and full 800 MHz range.

The three units considered are;

1. BCT3000
2. RS PRO 26
3. AOR 8000

The AOR 8000 is the front runner in my mind, but I have some concerns,

* Is it really a "clean" receiver, w/o intermod, etc.?
* Is the shortwave/SSB feature useable?
* Is there any negatives to ordering one from Canada with
full-coverage & the U.S. bandplan?

Thanks for your help in advance.

Message-ID: <56o68a$pcm@wnnews1.netlink.net.nz>
Source record: 217320

: features that the new MVT-9000 doesn't have either) and to many the RS232
: and Scout could possibly make or break.

I need computer-aided management of hundreds of frequencies (manually entering that many frequencies into a scanner is a major waste of time) and I do lots of frequency discovery with my Scout. So, yes, those features are very important.

: Invariably you will find that current or past owners of both the Yupiteru
: MVT-7100 & the AR8000 will say the MVT is the better receiver and
: outperformed by none (with such coverage) whilst acknowledging that the
: AR8000 certainly wins the features stakes.

OK, but how much "audio & RF performance" do you need? For a start, both of those are somewhat subjective and hard to measure. Since I don't have a 7100 to compare my 8000 with, I can only accept your judgement - but I do wonder how much difference it really makes to your use of the radio.

What is the difference in RF performance between the two? Does the 8000 overload? Is it insensitive? Strong images? What do you notice that actually makes a difference?

Same thing with audio - what's wrong with the 8000? Can you not hear the transmissions?

I accept your comparisons (I don't have much choice, I can't make my own) but I do question the importance you assign to this perceived difference. It may be there, but how significant is it?

At the end of the day, its your overall enjoyment of the scanner in your chosen application that is important. These two scanners are at the higher end of the market, and I just don't accept that in those conditions many people would be willing to trade 50% of the AR8000's features for a 10% improvement in reception performance.

: If RS232 and Scout control is not a "critical" feature then the performance
: and audio of the MVT-7100 might just be something that could swing the day.

The 7100 seems to be missing more features than those, and I remain to be convinced of the importance of the 7100's better "RF & audio performance". I'm sure its nice to have, but I'm not sure its worth losing features for.

Daniel.

Date: 1996-11-17 00:00:00 UTC
From: kc7anq <kc7anq@azstarnet.com>
Message-ID: <328FBBA6.62B9@azstarnet.com>
Source record: 217327

Does anyone have any idea what frequency the transmitters used for tracking back robbery suspects are on? I'm sure it's just some type of data or beep type of signal, but I was just curious.

Many patrol cars of the receivers in their car and three antenas in a triangular pattern on the roof of the car, as well as some fixed receivers. Just curious what frequency those receivers listen to.

Thanks,

Dan

Yeah, I have seen that pick-up too. I am not too sure if it is the same
one. The one I see is based out of the El Cajon office. It has to cool
'V' lightbar on top. I saw that bad boy light up a semi the otherday.

I am new to the Twin Cities and have been trying to "piece together"
some frequencies for the Minneapolis area, specifically the southwest
suburbs (Bloomington/Eden Prairie).

Can anyone supply any of the following:

Ambulance services for Minneapolis, Bloomington or Eden Prairie?
Minnesota State Patrol in South Minneapolis area?
Is Bloomington PD's trunked systems "digital"?
Anyone have a listing of all Minneapolis area Fire Departments?

Thank you VERY much for any assistance anyone can offer!

Ed

MA>Well, the last I hrd,, RCMA has folded due to expense problems in
MA>getting their bulletin out the door. They had a rather large bill in
MA>the bin waiting to be paid and no real funds since one of their
MA>distributors wasn't holding up their end of the deal (so I hear,
MA>anyone got a better explanation?

Essentially, you have the RCMA story correct. One of the magazine
distributors that they were using failed to turn over several thousand
dollars worth of receipts to the Association. As a result the
Association fell into arrears and was unable to publish from June on.
They worked a deal to incorporate RCMA into USSN, and all editors from
RCMA were offered "volunteer" positions at no pay.

I am not sure about the USSN, the rumor mill saying that
MA>their writers haven't been paid in a while. Sad to say, it seems
MA>this organization appears to also have the old financial woes. 73s
MA>Mike

There were a number of posts a while back that said there was a wage
dispute between USSN and some of it's writers. As a result, I opted not
to continue with RCMA and my association with the organization ended. I
don't know what the current status of RCMA or USSN is.

What do you do for 'limiter' stages? That is, what removes the
fluctuations
in signal strength on the input (receiver) frequency ? If simple
translation were *really* the output signal would vary as the input
signal strength. (Yes?)

AND when the incoming carrier goes away ... how does the simple
translater
know this (hmmm ...).

> >
> > I have never seen or heard of a land mobile radio system where the signal
> > wasn't demodulated all the way down to baseband audio before

Neither have I ... but I suppose it *could* happen ....

None of the Moto Motracs, GE MASTR PROs, GE MASTRs, Moto Micors ... nor
the few
RCAs repeaters I played with 'translated'.

> >
> > A good squelch circuit can be fast enough that the noise burst can be
> > completely eliminiated. The use of PL or DPL will also eliminate the noise

IF, as Moto did, reverse the phase of the transmitted PL momentarily
before dropping the carrier ... otherwise PL is worse (longer
squelch-noise
tail).

Also, the Moto Micor carrier squelch was VERY good. On strong signals
there was no noise burst. On the 6 and 450 reptrs that we've got in
service you know you've got a weak signal into it if there is a squelch

noise burst when you un-key.

In the ACC controllers there was also an audio delay line ... this
gave the TT decoder a chance to recognize the tones and mute. The audio,
delayed to the xmtr, would be cut off and the tones would not come
through. Similar trick can be used with carrier squelch and audio delay
line.

> > burst.

: frequency network? Yes, they applied for licenses, but who hasn't. Do
(...)

Conspiracy theories are so much fun. On Pp54, in the Nov 96 issue
of Mobile Radio Technology is an article on how the FCC is handling
the current auctioning of the 220-222Mhz spectrum. Bidding is expected
to be in the millions of dollars per market. I can just visualize
someone at UPS saying "We didn't know it was worth so much. We could
have had it all to ourselves" or some variation on that theme. I don't
think that UPS is vindictive or retaliatory. It's like blaming the
energy crisis on the guy the pumps the gasoline.

Incidentally, for a nominal $10,000 deposit (refundable), you can bid
on these 220Mhz frequencies. All you need is a computer, modem, the
FCC auction software, and $2.30/minute. The 900Mhz auctions went for
5 months, so this per minute bill could be substantial. They expect
2 to 9 rounds of bidding per day for at least 90 days. If 220Mhz is
that important to ham radio, hams could simply buy back the frequencies.

There are a slew of brand-spankin new 1996 Caprices without lightbars.
Almost all of the cars here at the Ventura Station are slick-tops. There
all of a sudden a bunch of slick-tops surfacing in Southern California.
They have a single red light mounted by the rear-view mirror on the
winshield and the back deck has a directional bar and pair of red/blue
lights on each side.

> Mabye someone can answer this for me. Why is it that some CHP cars are
> all white, and the officers assigned to them seem to have blue BDU

> but I am not sure.

Many all-white CHP cars are truck enforcement units, the officers in all
blue jumpsuits are the same guys you'll find at the scales. I don't
remember what thier official term is though. You'll also see these guys
driving the pick-up trucks. Don't go blowing past the trucks thinking
they can't pull you over, they can and will, they are regular CHP
officers and will nail you. A few years ago they had "stealth" cars, a
number of units were painted in odd colors, red, blue, teal, biege, grey.
They had the spotlights removed and small strobes on the back deck, with
a red light by the rear view-mirror. They kept the all-white door with
the CHP logo, California law says that a police unit must be clearly
marked with a logo on the front doors to be used in traffic enforcement.
A undercover can pull you over, but legally, cannot issue a citation for
a traffic violation. The coolest thing I saw was a dark blue station
wagon used as a stealth car.

There are a also a few all white K-9 units that are clearly marked
with K-9 on the car. You can tell the difference easily by the fact the
K-9 cars have extremely dark tinting on the back window and the rear side
windows to keep Rover cool, also hence the white paint. I have seen K-9
officers in the regular CHP uniforms and black jumpsuits, but I think the
black jumpsuits are used for special ops and not regular patrol.

THIS IS THE FAIREST MOST HONEST WAY I KNOW TO SHARE THE WEALTH!
Hello!

Would you like to make thousands of dollars, quick, legally, with NO

CATCH? Then keep reading....please take five minutes to read this

article it will change your life, just like it did mine. It's true!

You can make up to or over $50,000 dollars in 4-6 weeks, maybe sooner!

I SWEAR I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're

intrested, keep reading; if you're not, I apologize for wasting your

time.

Here we go. A little while back, I was browsing through these

newsgroups, just like you are now, and came across an article similar
to

this that said you could make thousands of dollars in weeks with only
an

initial investment of $5! So, I thought, "Yeah, right, must be a
scam",

but I was curious, like most of us , so I kept reading. Anyway, it
said

that you send $1 to each of the 5 names and addresses stated in the

article. You then place your own name and address in the article at
the

bottom of the list at #5, and post the article in at least 200

newsgroups (there are thousands). No catch, that was it!

So after thinking it over, talking to a few people first, I tried it.

I figured what have I got to lose except for 5 stamps and $5, right?

Well, guess what...within 7 days, I started getting money in the mail!

I was shocked! I still figured it would end soon, and didn't give it

another thought. But then money kept coming IN, tripling in size and

multiplying by 10-20 times the amount that I got the first week! In my

first week I made about 20 to 30 dollars. But by the end of the second

week, I had made a total of over $1,000!!!! In the third week, I had

over $10,000 dollars, and it's still growing. This is my fourth week

(Oct 11) and I've made about $42,000 TOTAL, and the money is still

coming in.....

Let me tell you how this works and most importantly, WHY it

works...also, make sure you print a copy of the article NOW, so you get

the informatoin off of it, and begin making money.

The process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 5 seperate pieces of paper and write the following on each

sheet of paper..."PLEASE PUT ME ON YOUR MAILING LIST. YOU ARE NUMBER

4." Get five $1 bills and place ONE inside each piece of paper that you

just wrote on, and fold each piece of paper so the bill will not be seen

in the envelope (otherwise, nosey people who like to steal envelopes

with money in it will get yours). Put one paper inside the envelope and

seal it. Do the same for all 5. You should now have 5 envelopes

sealed, EACH have a piece of paper AND a $1 bill stuffed inside of the

paper. Make sure those words that were stated above are stated on each

paper. What you are doing is creating a service by this, this is

PERFECTLY LEGAL. Now then, mail the 5 envelopes with the paper and $1

in each to the following 5 addresses:

1. D.Buff, 6503 Whispering Oaks, Wharton,Tx 77488

2. S.Shaw,611 23rd Street, Sacramento,Ca 95816

3. G.Charters, 5809 Hudson St.,Vancouver,B.C. Canada. V6M 2Z2

4. C.Blair, 1047 E. Appleblossum Dr.,Highlands Ranch,Co 80126

5. E. Long 626 I street #605 Sacramento, CA 95814

STEP 2: Now take the #1 name off the list that you see above, move the

other 4 names up (5 becoming 4, 4 becoming 3, ect.) and put YOUR NAME as

number 5 on the list. You can slightly alter this article if you need

to, editing what you need to edit.

STEP 3: Post your amended article (with your name at #5) to at least

200 news groups (I think there are close to 18,000 of them). All you

need is say, at least 200. HOW TO DO THIS: If you have Netscape 3.0 do

EXACTLY the following:

1) Click on any news group like normal, THEN click on 'TO NEWS', which

is on the far left when you're in the newsgroups page. This will bring

up a box to type a message in.

2) Leave the newsgroup box like it is, CHANGE the subject box to

something flashy, like, "NEED CASH $$$ READ HERE $$$" or "FAST CASH"!!!

3) Tab once and you should be ready to type. Now, retype (only once)

THIS whole article WORD FOR WORD, except to insert your name at #5, and

to remove #1 off the list, plus any other small changes you think you

need to make. Keep almost all of it the SAME!

4) When you're done typing the WHOLE article, click on FILE in THIS

BOX, RIGHT ABOUVE SEND, NOT WHERE IT SAYS NETSCAPE NEWS ON THE FIRST

BOX. Click on SAVE AS when you're under FILE. Save you artcle as a

text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE

UNTIL YOU DO THIS. Once saved, move on to number 5 below.

5) If you still have all of your text, send or post to this newsgroup

now by just clicking send, which is right below FILE, and right above

Cc: .

6)Here's where you're going to post all 200. OK, click on any news

group then click on 'TO NEWS', again in the top left corner. Leave the

NEWSGROUPS BOX alone again, put a flashy subject title in the SUBJECT

BOX, hit TAB once you're in the body of the message, and then click on

ATTACHMENTS, which is below the SUBJECT BOX. You will get another box

to come up. Click on ATTACH FILE, then find YOUR file that you saved;

click once on the file, and then click OPEN' now click on OK; if you did

this right, you should see your file name in the attachments box, and it

will be shaded green.

IF YOU USE IE EXPLORER IT'S JUST AS EASY...HOLDING DOWN THE LEFT MOUSE

BUTTON, HIGHLIGHT THIS ARTICLE. THEN PRESS THE "CRTL" KEY AND THE "C"

KEY AT THE SAME TIME TO COPY THIS ARTICLE. THEN PRINT THIS ARTICLE FOR

YOUR RECORDS TO HAVE THE NAMES OF THOSE YOU WILL BE SENDING $1 BILLS

TO. NEXT GO TO THE NEWS GROUPS AND PRESS "POST AN ARTICLE" A WINDOW

WILL OPEN. TYPE IN YOUR HEADLINE IN THE SUBJECT AREA AND THEN CLICK IN

THE LARGE WINDOW BELOW. PRESS "CRTL" AND THEN "V" AND THE ARTICLE WILL

BE PLACED IN THE WINDOW. IF YOU WANT TO EDIT THE ARTICLE, DO SO AND

THEN HIGHLIGHT AND COPY IT AGAIN. NOW EVERYTIME YOU POST THE ARTICLE IN

A NEW NEWSGROUP ALL YOU HAVE TO REPEAT "CTRL" AND "V" AND PRESS POST.

7)That's it. Each time you do this, all you have to do is type in a

different newsgroup, so that way, it posts to 200 DIFFERENT newsgroups,

you see? Now you just have 199 to go!! (Don't worry, each one takes

about 30 seconds, once you get used to it) REMEMBER 200 IS THE MINIMUM.

The more you post the more money you will make.

AND THAT'S IT!!! THAT'S THE ONLY 3 STEPS THERE IS!!!

You are now in the mail order business and will start recieving your $1

envelopes from various people all over the world within days. HINT THE

MORE NEWSGROUPS YOU POST TO, THE MORE MONEY YOU WILL MAKE. You may want

to rent a PO Box eventually because of all the mail. If you wish to

stay anonymous, you can come up with a name, such as "manager" or

"investor". Just make sure all the addresses are CORRECT, please.

LET ME TELL YOU WHY THIS SYSTEM WORK!!!!

Out of every 200 postings, let's say I ONLY recieve 5 replies, which is

actually VERY LOW. So I made 5 dollars with my name at #5. Now then,

each person who just sent me $1 makes, say only 200 postings, now with

your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including

yours too. 50 people send you $1 now; thats $50 you just made! Now,

then your new 50 agents post 200 each with YOUR NAME AT NUMBER 3, OR

10,000 POSTING (50x200). Average return is 500 at $1 each is $500.

They make 200 postings, which is 5,000 returns at $1 each, which is

$5000 dollars! And finally, 5000 people make 200 postings wach with

YOUR NAME AT NUMBER 1. YOU NOW GET A RETURN OF $50,000 BEFORE YOUR NAME

DROPS OFF THE LIST. AND THAT'S IF EVERYONE MAKES 200 POSTINGS ONLY, AND

IF ONLY 5 PERSONS RESPOND!!!!!

When your name is no longer on the list, you just take the latest

posting that is appearing in the newsgroups, and SEND OUT ANOTHER $5 TO

THE NAMES ON THE LIST, PUTTING YOUR NAME AT 5 AGAIN. And start posting

again. The thing to remember is, do you realize that THOUSANDS OF

PEOPLE ALL OVER THE WORLD ARE JOINING THE INTERNET AND READING THESE

ARTICLES EVERY DAY, JUST LIKE YOU ARE RIGHT NOW!!! So can afford $5

dollars and see if it really works? I think so.....

People have said, "What if the plan is played out and no one sends you

the money?" So what! What are the chances of that happening when there

are TONS OF NEW HONEST USERS AND NEW HONEST PEOPLE who are joining the

Internet and newsgroups everyday and are willing to give it a try?

Estimates are at 20,000 to 50,000 new users, every day, with THOUSANDS

of those joing the actual Internet. Remember, play FAIRLY and HONESTLY

and this WILL WORK, I PROMISE YOU!!! You just have to be honest. Make

sure you print this article out RIGHT NOW, also, try to keep a list of

everyone that sends you money and always keep an eye on the mnewsgroups

to make sure everyone is playing fairly. REMEMBER, HONESTY IS THE BEST

POLICY. YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE MONEY!! GOOD

LUCK TO ALL AND PLEASE PLAY FAIRLY AND YOU WILL REAP THE HUGE REWARDS

FROM THIS, WHICH IS TONS OF EXTRA CASH!!!

**By the way, if you try to decieve people by posting the messages with

your name on the list and not sending the money to the people already on

the list, you will not get much. Someone I talKed to knew someone who

did that and he only made $150 dollars, and that's AFTER seven or eight

weeks! Then he sent the 5 $1 bills, people added him to their lists,

and in 4-5 weeks, he had over $10K.

THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE

WEALTH OF THE WORLD WITHOUT COSTING ANYTHING BUT OUR TIME!!!

To: ALL
Subject: scrambling... speech inversion???

does anybody have any info on decoding this 'inversion-type'
scrambling..??

The area detective channels are using this method... anyway, I was told
that's what it was..??.... kinda sounds like those TV interviews, where
they try to disguise the person's voice... exept worse, of course.

any info is appreciated....

Rob.

I suspect what you were hearing is the "imagine frequency" which is usually
21.6 or 21.8 Mhz above the true signal. Using this method, most single and
double-conversion 900-Mhz scanners can get the lower-part of the cellular
band (with reduced senstivity). I think the FCC is now requiring
manufactorers to go to triple-conversion on the newest models to prevent this
mode of reception.

4204. RF in Light Bar?

Newsgroup: rec.radio.scanner

I was watching QVC and they had a Cobra Radar Detector that also "radio signals that light bars transmit when they are turned on." To demo this the host turned on a red and blue police type light bar and the radar detector started churping away. He said that if police turn on the light bar it is designed to warn other police, fire and EMS that another emergency vehical is near by and use caution. I have never heard of this RF in the light bar. Is this true, and what freqs. are used for this light bar RF?

Ive just got a question about the AR8000 scanner.

Whenever I set the 'mode' to 'auto' it quite often chooses the wrong mode for the freq I enter. I realise that the modes for different freqs would be different world wide so is it possible to change the settings via the keyboard?

Id like to be able to enter say a freq of 465.600mhz with the radio choosing NFM instead of WFM.

Also what keys do I press to DELETE all the memory contents. I DO NOT want to do this but I want to know what keys to AVOID pressing.

Many Thanks

Matt

>but you can bet your last dollar that this is what the future holds.
>
>

I think this will be long way off, especially if the current scanner
crowd spends time and $ now to learn as much as possible about the current
crop of digital stuff. The more we learn now, the better we will be in
the future.

Mfg's claim they use scrambling, but this is to improve reception, not for
encryption. Because of the confusion caused by the word 'scramble', many
people will be convinced that they are buying something more secure than
they really are.
This will be our salvation.
cheers

What you will need is a computer interface, and a program such as ScanStar which has a bandplan editor. The mode which the radio automatically selects is determined by the bandplan in the radio's memory, and can be edited with a computer.

: Also what keys do I press to DELETE all the memory contents. I DO NOT
: want to do this but I want to know what keys to AVOID pressing.

I do not believe there is a way to do this. There is a reset method where you hold down the CLEAR key while turning on the radio, this resets many settings to defaults but does not erase stored channels. In fact, I've seem complaints that this radio is too difficult to erase in a hurry. This is a concern in the U.K. where monitoring police frequencies is highly illegal.

If it's just plain speech inversion, RAMSEY sells a speech inversion descrambler/scrambler and it works fine. Again, it has to be plain generic inversion. We have an agency around here that uses scrambling that sounds like plain, basic inversion, but if you listen close enough you hear a small tick every few seconds, and that cannot be descrambled, although it sounds identical to the normal inversion.

YES, they have been doing this since about 1989 or so.
I didn't realize that they were still doing that. I
think that they said that they were only using them
in high traffic areas. ie; not in the boondocks :]

I have seen a black & white CHP pickup truck on I-15, northern San Diego Co. It has a white cap and twin whips on the rear bumper. Also are the base-loaded antennas on the new CHP crusers & Mustangs K-40 brand antennas? Thanks, Steve Ralston, Escondido, CA

Use a computer interface and a program such as scancat-gold or radio
manager
the band plan that comes with the ar8000 is incorrect
the program will fix it.

First of all, no, I would highly recomend that you never buy anything over the internet, least of all a scanner that some idiot has been re-soldering, and lnternaly modfying. For the rest of your questions, you should definetly go to Radio Shack, they will answer all of your questions, and it would be a good idea to buy your first scanner from them. I hope that his helps, and enjoy the rest of your stay in America!

It is possible to monitor cellular with a 2006, and to some extent
zero in on a particular phone and even track it. If theradio is
programmed right, and you have a decent outside antenna.
Specifics are in The Phone Book from Lysias Press. Available special
order Barnes & Noble, Borders, etc.

The chirp is the LOJACK unit ID. It is what the receiver in the police car displays when the signal is received. Once a lojack has been activated it transmits once a minute (I think). Once an active search for the vehicle begins the unit is instructed by the system to transmit more frequently (every 15 seconds I think) so the police cars can track it.

You are going to aggravate them?????

What is the big deal? You ship something COD. You have a receipt. (You do-don't you?) (Then again you may not since you did not even know where the $255 came from). If you don't receive the money in a reasonable amount of time you ask for a trace. If they show a delivery they will have to provide a payment. If they don't show a delivery you still get paid because they lost your package. It may take 30 days but is it worth getting an ulcer over?

4229. BC 3000XLT: Triple Conversion is unmodifiable?

Newsgroup: rec.radio.scanner

After watching lots of questions, most of which asked about the Cell-phone frequencies, go by about the Uniden Bearcat 3000XLT Portable Scanner, I began to look for information from some web sites and one of them mentioned that because it was a triple-conversion type of scanner, it could not be modified to add Cell-phone frequencies. Is this true?

I have a BC 3000XLT, and in order to enable the Lock function, you must hold down the Lock Key for a few seconds until the Key sign appears in the display. While the key sign is displayed, no other buttons will respond. To disable the Lock, hold down the Lock-button until the key goes away.

On the bearcat, just hold down the lock button until you hear a beep.
This lets you lock the keypad so that you won't accidentally hit a key
while scanning. If you want to unlock it, just press and hold it n until
you hear another beep.

4236. MVT-9000 Initial "comments"

Newsgroup: rec.radio.scanner
Date: 1996-11-17 00:00:00 UTC
From: Clough@javiaton.demon.co.uk
Message-ID: <848236682snz@javiaton.demon.co.uk>
Source record: 217410
Cross-posted to: alt.radio.scanner.uk,alt.radio.scanner,rec.radio.scanner,aus.radio.scanner

Hi,

Well after several days "on hands" use of the new MVT-9000 there are a few ammendments to make to the initial specs (due to me not quite getting the Japanese correct first time around !).

* Frequency coverage is 100Khz - 2039MHz (Specs state 530KHz +)

* Modes of NFM, WFM, AM, NAM, LSB, USB & CW

* Step sizes of 50, 100, 200 & 500Hz. 1, 5, 6.25, 8, 9, 10, 12.5, 15, 20, 25, 30, 50, 100 & 125KHz.

There is a "Preset" mode (Automode Bandplan) which will select the mode and step size for each frequency entered...likewise with the AR8000 this can be overidden with any mode or step size. I did think you could select the mode and step to be associated with any particular range of frequencies from the keypad but it seems this can't be done.

* Twin VFO
* 1000 channels are in 20 banks of 50
* There are 20 search banks tagged a-j & A-J. Seen that before somewhere :-)

* Multi function Large LCD Display
The "layout" of the LCD will be recognised by Yupiteru owners although it is now very much in line with the AR8000's. The main part of the screen is very clear and concise with the lower section being a Dot Matrix Display (AR8000) used for the Bandscope, Alpha Tags and signal strength indicator. Certainly a little sharper on the eyes overall.

* Similar family keyboard layout & operation to previous MVT models.
Any owners of earlier MVT's should be able to get the MVT-90000 up and running without any problems - the keypad and way it "works" are very similar to the earlier models although there are a few features I have yet to really work out. The FUNC key is now a small button just above the LCD screen...I still keep pressing the bottom right where its been on all previous models :-(

Overall on the RF side of things it would seem it keeps Yupiteru up there at the top in RX performance. I'm not really in a high RF environment here so to tell how it compares to the earlier MVT's in major cities with high RF is rather difficult at the moment...so far its been as clean as you could want with me...as I say though subjective a little. Internally though it is well shielded from "local" RF interference (this should also allow for CE approval here in Europe to be a breeze...we'll see).

The Bandcope works well and various bandwidths can be set. With the bandscope on you can mark the center frequency (VFO A) and then use the rotary dial to move a marker up/down from the center point - the lower frequency display (VFO B) then displays the frequencies up/down from the centre so you can read off the frequency on which activity is being displayed....hit the monitor key on the side on that frequency is then received...hitting ENTER sets this as the new center frequency.

Despite the good RX performance and construction it lacks two major things....Computer Control and Alpha Tagging of each memory channel. You can alpha tag upto 9 characters to each Search Bank and each Scan Bank (one block of 50) but you cannot alpha tag each channel.

Once a Scan Bank is tagged and any frequency within that bank is recalled manually or it stops on that channel whilst scanning the Alpha Tag will show...however it flashes at you all the time....a little distracting to me :-(

On Power on the Matrix Display shows: *Yupiteru *
* MVT-9000*
This can be changed (11 characters per line) to anything you want.

The delay is still the same as the earlier MVT's...ie Global (cannot be selected per channel) and with it off there is a short delay - with it on this extends to around 4 seconds. The Attenuator is per channel though.

For what its worth the internal ferrite bar antenna for AM can be switched on or off via the keypad. Scan and Search features are very much as before and the backlight can be turned on or off permanantly if you wish.

The MVT-9000 is most certain to be at the top of the current scanner price ladder (& by a fair way at that). First impressions do suggest its going to be a very good receiver indeed its just a shame that after such a long time waiting for the MVT-7100/7200 follow on Yupiteru have not seen fit to add Computer Control or Alpha tagging - these two features alone together with the Yupiteru RX performance would really have made the '9000 the "Yupi Killer RX" many had hoped for, as its is the MVT-9000 will have its market share, many being previous/current Yupiteru owners.....its just not going to be as big as it could have been.

4237. For Trade: mint BC-200 W/Cell mod

Newsgroup: rec.radio.scanner
Date: 1996-11-17 00:00:00 UTC
From: Radioman@localnet.com
Message-ID: <56o49s$hkh@prometheus.localnet.com>
Source record: 217411
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Have a mint BC-200 (cell mod done) with leather case, charger, antenna, manual, original sales slip & box w/packing. I would like to trade for a likewise mint radio shack Pro-43 handheld scanner. The Pro-43 should either have the cell-mod done or be of the appropriate date code to signify that it was imported prior to the cutoff point for that.
May consider an alternate but am really looking for the Pro-43.
E-mail radioman@localnet.com if interested.
Regards,
Ray Miller N2NJK

>I've read a couple of "Cool stuff coming.." from magazines, but nobody
>seems to have lots of details. Anybody know more?

Apparently not.

But the rumors *I* have heard make this to be underwhelming ... a scanner
without a keypad?

: tune as necessary?

Discones are omnidirectional (they are not beams) and therefore there is
no point rotating them.

I doubt there'd be much point tuning one, either.

: What's the best replacement rubber antenna for the one that comes standard
: with the radio?

Anything.

Take off the standard antenna, and stick your finger in. That'll be an
improvement. ;-)

I use Grove's 42in telescoping whip. Besides the fact you can extend these
to 42in, you can adjust them to suit the frequency you want best reception on.
$16.95 from Grove.

Why pay more than that for a less versatile rubber duck?

Daniel.

Newsgroup: rec.radio.scanner
Date: 1996-11-17 00:00:00 UTC
From: muldooninc@aol.com
Message-ID: <19961117033400.WAA27377@ladder01.news.aol.com>
Source record: 217466

I have been running it with some success on WIN95 on a 60 MHz Pentium and a SoundBlaster Pro 16 bit soundboard. The sound level is critical, some frequencies it decodes better than other.

If I stop decoding then start again it wll almost always lock the computer up.

After some fussing what I can usually get is several messages followed by preamble then sync error. Through trial and error it seems that parity error is a bad thing.

Some technical specifications about the program would be helpful, like the speeds it will decode.

All in all a very cool program. I am looking forward to a higher accuracy rate

Does anybody have the line level mods for a AOR 1000, Pro 39, or Pro 52 ?

Tim.

Keep playing with the volume on the scanner, and the volume control on your Soundboard, check your recording settings and make sure AGC (automatic gain control) is turned off. And try a different pager frequencie.

>it could not be modified to add Cell-phone frequencies. Is this true?

Yes and no. Uniden Bearcat 3000XLT cannot be directly modified to
receive cellular but this has nothing to do with the scanner being
triple conversion.
The US version simply has a CPU (the unit that controls all the
logic of the scanner) that prevents it from tuning the cellular
frequencies.

My home page is in construction , (but you can visit now)
http://www.geocities.com/Paris/8718

This is a Radio scanner homepage , but i dont have many frequencies .

I dont want to make a duplicate of an other ham page on the web , but i
want to collect
frequencies which aren't on another hamradio page .

If you have frequencies in HF VHF UHF , which are not on the web then you
can mail me theses.
If you can send this in .xls(excel) it is the best , but .txt .htm .html
(if it could de read easy)
.doc .wri . are accepted (for others files ask me)
Of course if you have an .zip file it is good , but dont send .exe (my
host don't accept this files)

The frequencies of all the world can be send .

I have 5 Mb for the hamradio on my homepage , if you have some ideas for
this the say me what .
Why not an ham radio forum ?

Now i wait for your answers

enjoy !

Don't buy Radio Shack products then. If they want to be like that then
screw them!
If they ever treat me like that I know for a fact I will not EVER go
back into the place.

I only wish Walmart would start carrying conectors, coax, and
resistors......The shack would fold in a year or two!

Make sure you hit "Func"+"0"(which is the copy mode)
select send mode
then youll have 2 options "Bank-Data" and "Sys-Data"
select sys-data
set up your program per the instructions to upload the band plan
start the program then hit enter on the radio
it should be that simple

> I can't even receive cordless phone frequencies? Can someone please tell me how
> I can modify? or send the scanner to remove the limitations? Thank you.

Where was it purchased (Country ?)

The above would possible suggest you possible have a unit that was originally destined for somewhere like the German market where until recent years the ony "coverage" receivers could have were the varios Amateur Bands. After saying that though I would have said that the X1 came out after that legilsation came to an end as as far I was aware all DJ-X1 had full 500KHz - 1300MHz coverage.

Are you sure you cannot enter frequencies between the above limits (123.45 for example ?) If its is limited to the above frequencies its the first time I have heard of such limits on the X1 and at this time I am unaware of the "mod" required to restore full coverage.

Alinco venture into the scanner market with the X1 didn't seem that successful but it seems they ahve not been put off and they have a new unit due in the new year (DJ-X10 I beleive).

Yes the CHP did change the color of the cars to out fox the public < as
a test>
They had white, blue, gray, tan and its like a pink
The public yelled and yelled
I was told that they are not going to color cars
The pick ups are for code/truck ins.
In the snow areas pick ups and Suburbans
They also have some Suburbans for special ops.
The CHP has been doing more then code/highway/speed work as of late
They are starting to look like calif state police dept
==========
Have you looked in the cars
They not only carry 12ga.Shot Gun
They also carry a AR-15 as of late
In the bay area car has a 12ga. and an AR-15
The motor units have had 12ga. for some time.

Dear Sir,

I would recomend Realistics Pro-26. It it a wounderful scanner and runs
from 25 - 1300Mhz. If you want it to cover all frequs, order the scanner
from europe, the restrictions are not on the scanners there.

David,
For the 3000, simply hold down the lock key until the scanner beeps.
The locked key symbol should appear in the LCD. Hold down the lock key
until it beeps...you're unlocked. I'm sure it probably works the same
for the 230.

John,
You'd probably be better off getting the Pro-26. I've had a few
e-mail converstaions with Jonathan of Javiation who recommends this
scanner. Although it does have 400 channels, it only has 4 banks.
Worse yet, once a frequency is programmed, it can not be locked out
for scanning purposes. This is a big drawback to me. It supposedly
gets 5 hours or so on two AAs but I worry about audio volume. Unless
you really want a scanner simply because of its size, I would not
recommend this one. Like the Icom R-1, this is more of a communi-
cations receiver than a scanner.
Save some money(if you buy the US version) and get more bang for
your buck. For an equivalent amount of money you can opt for the
Eurpean version of the 26 which Javiation sells for full 800MHz
(although other regions will be blocked as per European restrictions).

Strong signals,
Rich Wells

I had mine modified for $40 from Scanners Unlimited in San Carlos, CA.
It was so bad on the 8000 when new that I thought I had a faulty unit.
I guess the internal filter is too narrow for 800mhz reception and they
just swap it out for a slightly wider one and it seems to fix it.

I imagine this would affect cellular listening if you are into that sort
of thing, too.

This is an interesting comment. I have a PRO-39 that was
cellularly circumscized, and the audio went to Hell only in the
800 mHz range. I sent it back to XXXX, and they said that the
speaker was defective, and that they have seen similar problems in
the past with other hand helds. They suggested useing an external
speaker, and that seemed to solve the problem.

I agree with all that has been said ..... but

I love my WS1000, won't ever sell it !!
matter of fact I'll buy another.. ANYONE have one forsale ??

Anyhow.. mine is even better then 5 hrs on batteries , more like 10 or more,
that is scanning already programed freqs, using headphones.

The antenna that comes with it is ok , but to get the lower and upper ends,
use a diffrent antenna !

The sound quality is alright, for its size.

Easy of use is pretty good. I had to read the manual once, then
go back over it a second time to answer the tough questions....

I got mine for $325 used, which is better than the $450 retail price....

but as rich said already, great 2nd or 3rd .... scanner !

The BC210 has three electrolytics in proximity to the TBA 820 audio amp.IC. They are: 220 uF 16VDC adjacent pin 12, 47 uF 16VDC adjacent pin 1, and 22uF 10VDC next to the 47uF, but further away from pin 1. Hope that helps!! Best Regards, Dave Lovell, W9DAG - owner, Electra.

Actually U.S. scanner news did an article about this two years ago. The
transmitter is hidden in a stack of money given to the robber. I no
longer have this issue, but maybe someone could check their back issues.
In fact the only reason I got it was they sent it to me for free, I
didn't even ask for it.

It would be much safer to use the *line* input jack on the soundcard
rather than the mic input. Most mic inputs are amplified, so it would
be very easy to overdrive the mic inputs and fry something important.

You need to activate the Win95 volume control menu and click OPTIONS, PROPERTIES, then RECORDING. If your sound card is like mine, it can only record from one source at a time and chances are the MIC input is selected instead of LINE as the source.

Still, I have not had any success with the Win95 version of the decoder either. The old 16-bit version actually works better on my system.

: I have a "Friend" who "doesn't listen" to "cell phone calls", and he
: has a question.
: There are about 1000 frequencies in the 800mhz range. How are calls
: handled when there are more that 1000 calls being made?

They aren't. =) When you press your send button and the system is
at capacity, your phone will beep or signal you in whichever way it
normally does when the cell system doesn't process the call (on my
Ericsson, it sounds like a higher-pitched busy signal).

There is a "call class" designation that, when used, allows
certain people with a lower class number to have priority over other
customers. So, if they make a call and the system is running at capacity
already, someone's call is dropped so that this person can make his or her
call. On most systems, this isn't utilized though.

: Also, how large are the cells themselves. Several miles?

On the AMPS and (I think) GSM systems, cells have a max range of
about five miles. But, on the 1900MHz CDMA and other digital systems,
there's a possibility for cells with smaller coverage areas (less range),
meaning more cells, greater frequency re-use, and greater capacity.

: Is a call broadcast througout the country? How does it find "his"
: phone?

Again, using AMPS as the example (since that's the common system
in the US), when a person makes a phone call, their ESN is transmitted to
a cell tower. The same occurs when you turn your phone on, and every few
minutes while your phone is on standby.

When you get a call though, the paging channel at each cell site
in your "home" area broadcasts a request for the phone with that
particular phone number to respond with its ESN number. If your phone's
turned on and locked in on a paging channel, it'll send back its ESN, and
once the appropriate info gets exchanged between phone and tower, your
phone will ring (try this: go to a landline phone and dial in your cell
phone number. It'll take about one or two rings on your land phone before
your cell actually starts to ring. During this delay, ESN and call info
is being exchanged between your phone and the cell system).
Now, if the cell system doesn't get a response in the home area,
the search is widened to any "expanded calling areas" that your cell
company might have designated for you. If there's still no response from
the right phone, it widens out even further to any cell phone systems that
your particular company has automatic roaming agreements with (or, if

you've directly set up a roaming agreement with another cell company,
the call will be handed off to them).

And if there's still nothing, _then_ your caller will get a
message stating "We're sorry, the cellular customer you're trying to reach
cannot be contacted..." =)

Hope this helps,

: it could not be modified to add Cell-phone frequencies. Is this true?

Whether or not the unit has triple conversion doesn't have any
bearing on its ability to be modified. All it means is that you won't be
be getting image receptions of cell phone conversations in the 896-915
MHz area.

This doesn't mean the scanner is modifiable though. Manufacturers
are making it increasingly difficult to do as the newer models come out.

I'm doing a research paper for a college writing class dealing with management of the radio frequency spectrum. Any help will be appreciated in the following areas:
---
1. Listing of current and new digital users (including new thechnologies) and their allocated space in the spectrum.
2. Those non-digital or voice broadcast services in the business and public safety sectors and their allocations.
3. Aircraft communications (both voice and digital) and their allocations.
4. Satellite broadcast services and other satellite digital services (anf their specific allocations.
5. Radioastronomy allocations.
6. Cellular technologies and spread spectrum users and allocations.

My main theme is the effective management of all the above and maybe a few other services which I didn't mention. I'm also looking for problems which might have recently popped up regarding any of the above and possible solutions to those problems.

I've been able to glean some information from Broadcasting & Cable magaizine but, that's primarily for the commercial AM and FM broadcasting industry and for Television and Cable. I'm seeking info on the other specialized services as well.

Any help will be appreciated. Pleaee direct your replies to the following E-Mail address:
---
bjohnson@thekat.maximumaccess.com

Perhaps, you have a web page or home page or several of the se you can direct me to for more valid and up todate information. Thanks for your help in advance. Happy Monitoring...Brian.

* Crossposted from: SCANER_GROUP

The NEWCASTLE SCANNER GROUP was originally formed in 1990, to cater for scanner enthusiasts in the Newcastle, Central Coast and Hunter Valley regions. We also cater for SHORTWAVE LISTENERS World Wide with what is believed to be the lowest membership rates in Australia and the South Pacific!

What can we offer?

* Bi-monthly Newsletters (yes, plural): We produce TWO bi-monthly newsletters - one for the Scanner Division and one for our Shortwave Division. This means that we are not trying to cram information on HF, VHF and UHF frequencies into one newsletter! Whilst our newsletter may not be as large and fancy as some others, we don't list endless loggings of what you COULD have heard TWO months ago!

* FREE help and information: Whether it be Scanner related or Shortwave related, members can obtain totally free help or advice, any time.

* FREE Frequency information: Many scanner frequency lists, and even HF lists, are out of date before you even get them, so why waste the money?
Members can obtain FREE OF CHARGE information on the VHF/UHF frequencies used by local emergency services and other interesting services, or lists of Australian HF frequencies or updates on the HF scene, all upon request.

* Encouragment Awards: NSG has several awards available to Shortwave and Scanner enthusiasts for various accomplishments. These are aimed at getting
enthusiasts that little bit more involved. Non-members pay a small fee for
the issue of each award, but members receive them FREE OF CHARGE.

* MORE TO COME! As new members join or suggestions come in from existing members, we will add to the benefits of membership. The main idea of this Group is to allow enthusiasts to SHARE information and findings amongst each other - in other words, send in your latest findings or contributions to share so we can keep the newsletters, etc, full of information for everyone to enjoy.

Want to know more?

Get in touch! If you have questions or doubts, let us know and we will help you in any way possible. We do not charge anything for help or advice, even for non-members. NSG is a NON-PROFIT organisation, so all money raised from our low membership fees goes straight back into the

Group.

Bi>I was watching QVC and they had a Cobra Radar Detector that also
Bi>"radio signals that light bars transmit when they are turned on."
Bi>To demo this the host turned on a red and blue police type light bar
Bi>and the radar detector started churping away. He said that if
Bi>police turn on the light bar it is designed to warn other police,
Bi>fire and EMS that another emergency vehical is near by and use
Bi>this caution. I have never heard of RF in the light bar. Is this
Bi>this true, and what freqs. are used for light bar RF?

There are a couple of companies that make transmitters that fit into light bars that send a signal out when the light bar is activated. Cobra, and I think maybe a couple of other radar detector manufacturers are not making receivers that will pick up the signal and let you know if there is an emergency vehicle in the area. However, I don't know how many of the transmitters there are out there, and by no means do all light bars send out a signal. In fact, the only units that I have seen have been at trade shows.

Thanks Paul, this is exactly what I was looking for. I didn't realize I needed a helical antenna. I was goung to build a quagi but had second thoughts.

I did contact Monitoring Times...no response but I'll try again..at least look at their index and order a back-issue. I have all their issues for the past 4 years and that is the single missing issue...

There's a gizmo for $20 at Fred Meyers that takes the earphone output of
a device like a scanner and broadcasts it on an unused FM station.
Then, you tune your car stereo to that station and Viola!

It does work - I do it regularly.

One thing to watch is that (unless your scanner has a stereo headphone
socket) you need a mono to stereo (or rather, 2-channel mono) adapter.
Without it, the sound will only come out of one channel.

BTW, why would you want to have both the radio and scanner on? How can you
concentrate on what the scanner is saying with the radio on?

I believe this is the new Traffic Warning System (or something) that uses conventional speed-enforcement radar but modulates it with one of 64 possible PRFs or PRIs. New radar detectors will actually display a warning message which corresponds to the code transmitted. Old detectors simply alert you to the presence of police radar causing you to slow down prior to arriving at the scene. Pop Comm has had an article or two about it but I can't remember any more details.

No. You pick up the kit at the drug store (or apothecary for the
Europeans), totally anonymous as far as the company is concerned. You
mail in your blood samples with no return address, just a code number.
(You'd think I already checked into this..)

First off, this is a new one on me, so I'm only speculating....

Do I understand your post correctly that what is being picked up is
the modulated signal from radar speed guns? If that's the case, what
is the tie-in to light bars? What are PRFs and PRIs?

Mark

The truth as I perceive it to be.
Your perception will be different.

Ed,
Try and find the design calculations for a Helical receiving
antenna. This is the best type for FLTSAT SATCOM monitoring. I
had a friend in Louisiana who had several on his roof. They
performed quite well. I had plans for one in a monitoring times
or satellite times, I think it was Nov. 94 or 95. You could call them
at Grove Enterprises in N.C. and ask them which issue it was in.

Good Luck

Paul.....

See BOOK OF MORMON, JAREDITES. Deseret is the Jaredite name for honey bee. (Ether 2:3.) Brigham Young and his followers first named their new intermountain empire the territory of Deseret after this unique Book of Mormon name. The name has since been applied to many businesses and enterprises in the Utah area, and the beehive, as symbol of industry, is part of the great seal of the state of Utah.

Hope this helps!

From: toddz1@pixi.com
Message-ID: <56ouep$33k@rigel.pixi.com>
Source record: 217363

I witnessed a very happy potential scanner owner become a very displeased RS former customer. While waiting for a sales rep, to ask for a scanner directory, I overherad a sales rep telling the purchaser that he couldn't pay with a check, "Because 80% of our scanners purchased with checks end up bouncing." I guess they don't have a very good check approval system.

Oh, and their fifty cent scanner listing was horrible! Not only was it outdated and very vague, but it failed to list the secret service frequencies I wanted. Oh well, the president is only here for another 16 hours anyway.

It was my first visit to a RS in months, and now I remember why I stopped going.

loncaric@postoffice.ptd.net (Bob) wrote:

We have two years to ponder this dilemna and how it
will be solved....or ?

New computer technology developed for the military is
what this localized version is going to be canabalized
from....look what the military can do with speaking to
command units in Saudi Arabia from the USA by using the
link between them....satellite.

What's really ominous is that someone in Washington can be
the pushee of the buttons that enables a robot plane to take
off, move towards the subject that interests them, and then
get a pic of it and like Magic....subject bombed into
nothingness....and he did not even have to put on his uniform
and polish his boots to do this.

Technically he could be sunning himself in Hawaii and with his LapTop send a robot plane with a 1000 pound bomb or mini-bombs with 1000 of them able to be dispersed over a greater area and launched via software showing where the plane is and when it will lock on the to the laser directed at the sight to be hit from the satellite overhead....Vacationing General Saves USA For Democracy Ad Hoc.....

We just contacted RELM and they said that they no longer have plans for a full coverage version of the HS200. We apologize for any inconvenience this may cause. Please note that we still stock full-cell versions of AOR, Yupiteru, and Radio Shack. visit http://www.durhamradio.ca/scanners.htm

4349. External Speakers...

Newsgroup: rec.radio.scanner
Date: 1996-11-19 00:00:00 UTC
From: doc@dxnet.com
Message-ID: <3291e881.6897920@news.dxnet.com>

Cross-posted to: alt.radio.scanner,rec.radio.scanner

Scanner Fans,

I've done extensive testing with a array of external speakers on my ham radio equipment/scanners. These speakers included:

Three types Motorola, two types GE, Pace, Johnson, Uniden, University and many other assorted speaker manufactures... the strange thing is that a number of these speakers are designed for communications/voice frequencies, where the speaker cones are made more rigid to favor mid-range frequencies... without a doubt, the Radio Shack 21-549 External Speaker is the very best!

This speaker simply has outstanding, quality communications audio recovery! It is supplied with a bracket, about five feet of wire and a standard (3mm) jack for about $15. I highly recommend that you take your handheld in and ask to try it, or have them connect one to one of their scanners/receivers. I know you will be impressed and will take one home with you.

A ideal application is where you have a portable radio, mag-mount antenna and one of the above speakers mounted in your car. Two quick connectors and you are mobile with really GREAT sounding audio.

This speaker enhances your monitoring effort and has improved the overall audio quality of every radio I've tried it on. I took a moment just now to connect it to a Yaesu FT-530 dual-band hand held and the performance is superb, no amplifier required! I use one on a Yaesu FT-2400, FT-7400 and a PRO-2004. Monitoring without one is now out of the question ;)

F.Y.I., Radio Shack also made a Model 21-541 AMPLIFIED External Speaker. It looks just like the speaker above, but it requires 12VDC and it WILL knock your socks off with volume plus! I'm not sure if this one is still in the catalogs.

Please try one and let me know what you think? I know this speaker will bring your radio alive!

Good Doctor...

Sorry for the delays in this post, but 140.95MHz appears to be
assigned to the U.S. Navy as a simplex frequency.

It appears active at:
China Lake NWC and
Long Beach Naval Station (in the process of closing down).

It's been a while since I followed this group, but I remember that on "older" cell phones thier were sometimes "scanning" functions that could be accessed by certain key combinations. Well, having joined the ranks of the cellular connected with my new Nokia 232, I was just wondering if there were any known codes for this unit.

Just curious.

Just heard the "China Control" (China Lake, CA) frequency
(362.700) with some unusual traffic. They are giving a countdown
ending with "X-Ray" The traffic is from someone from Indian
Springs, which means that they are probably former Soviet
aircraft.

In my area - we have overlapping shifts of units with the same unit designators. "1 car 8" is 1st shift car 8 and "2 car 8" is second shift car 8.... and so on. When you have overlapping car numbers for an hour or so, it makes it alot easier than having 2 people answer back all the time.

Andrew,

What you are receiving is an image, around 21.4 MHz (10.7MHz the first IF x
2) above the cell frequencies.

Apparently to listen to cell frequencies, a double conversion scanner
should be set to search the frequencies between 894.0125 and 915.5750. I
have a RS Pro-29 and a Bearcat BC-230XLT and both will pick up this
image... not that I listen to them. ;-)

This might seem a dopy question. I have triple conversion on my
pro-60, should I search 32.1 MHz above? If this is so, would I need a
converter at all.

Thanks
Jon.

Haaa haah haaaaaaaahhhhhhhhhhh!

Have you *ever* heard two cops on two seperate systems try to
use a link between them? It is hilarious! It rarely works
smoothly because the radio systems operate differently
and the people using them have different operating techniques
and ways of communicating.

I think that voice telephony will be the preferred means of
inter-department communication for some time to come. It
might not be gee-whizzy high tech, but it gets the job done.

> than gadgets.

Don't even think about a AR2700, I have one, IT SUCKS!!! And at $400 it's
a big ripoff. I got mine for $200 new so $400 would be outrageous. The
2700 suffers from so many birdies, audio is weak, sensitivity is nil, etc.
GO with the PRO-26 or a BC3000XLT (Actually, the 3000 is quite the scanner).

I have a Uniden Bearcat BC-140 scanner that is about 10 years old.
Last week the a few of the buttons stopped working and now none of them work.
I have taken the scanner to a repair shop and they quoted me a price of
$20 for the part and $60 for labor. I only paid $100 for the scanner 10 years
ago and don't want to spend $80 for someone else to fix it so I decided to
do it myself. If anyone knows how I can order the circut board please
e-mail me at gahamilt@eos.ncsu.edu or post a reply.

Thank You.

Greg

If I remember correctly, it is in the same band as Ka radar (33.4 GHz - 36.0 GHz) I do not know the exact frequency. However, if you have a fairly sensitive detector without the safety warning feature, you might still pick up the signal as a low level radar signal. Ofcourse you can probably already see it by then.

My radar detector has this feature. Except for the power on self tests, it has never indicated reception of a warning signal.

I recently bought the CD Percom database. I was pleasently surprised that it is a very complete database.

It can search by city, county, state, etc...

It does have a quirk-
You can (do) get a listing in spreadsheet form, but you can not do anything with it except view it.
Initialy you have a multiple choice of:
1) Printing to screen
2) Printing to printer 80 columns.
3) Printing to printer 132 columns.
4) exporting to a database format.

I have not been successful in printing to 132 column format. My printer is a HP4ML postscript printer.

Overall I find the CD to be a good value (based on $29.95).

4376. Re: CHP colors

Newsgroup: rec.radio.scanner

From: ron.levine@solis.sbay.org
Message-ID: <961119090107397 89@solis.sbay.org>
Source record: 217199
Body handling: HTML body converted to readable text

-> Yes the CHP did change the color of the cars to out fox the public <
-> a test>
-> They had white, blue, gray, tan and its like a pink ford calles it>
-> The public yelled and yelled
-> I was told that they are not going to color cars
-> The pick ups are for code/truck ins.
-> In the snow areas pick ups and Suburbans
-> They also have some Suburbans for special ops.
-> The CHP has been doing more then code/highway/speed work as of late
-> They are starting to look like calif state police dept

CHP still uses patrol cars in different colors primarily for commerical traffic enforcement (AKA Truckers). It doesn't mean that they can't pull over the average driver though. Many offices are using all white cars these days.

The California Highway Patrol assumed the duties of the California State Police when that agency was combined with CHP. This includes the security of all State owned buildings (including patrolling the State Capitol in Sacramento) and properties (CalTrans yards, etc). The CHP now handles the Governor's Protection Detail also.

-> Have you looked in the cars
-> They not only carry 12ga.Shot Gun
-> They also carry a AR-15 as of late mini 14 in only a few cars>
-> In the bay area car has a 12ga. and an AR-15
-> The motor units have had 12ga. for some time.

The majority of units in remote areas (rural) all carry assault rifles. All the supervisor's units (Sgt's) carry the weapons in urban areas. More indivdual units are getting them in the urban areas though.

I hope this clears up some of the issues.

M> Scanner, I began to look for information from some web sites and one of
M> them mentioned that because it was a triple-conversion type of scanner,
M> it could not be modified to add Cell-phone frequencies. Is this true?
M> --Matt
--
Earlier this year I posted something to the effect that a simple
jumper would make it possible to receive cell phone images with the
Pro-26, which also has triple conversion. Lots of people have done
the mod and can verify that it is possible. I looked at the 3000XLT's
schematic and although the 800MHz band configuration is slightly
different (actually better than the Pro-26's), the jumper mod should
work as well. I would download the info for the 26 from whatever Web
page it's available, and then apply it to the 3000. Even though the
component numbering may be different, the same lockout principle for
individual RF sections applies, so one should be able to defeat it
as easily as with the 26.

4378. Best antenna/cable combo for 100-400 Mhz?

Newsgroup: rec.radio.scanner
Date: 1996-11-19 00:00:00 UTC
From: Michael_Cole@hp.com
Message-ID: <56rnqg$971@hpax.cup.hp.com>
Source record: 217201

I live in SF where hills make listening difficult in my part of town. I'd like to improve reception on my handheld Bearcat 220 XLT inside the house in the 100-400mhz range.. Thought about mounting an anntena on the roof of my apt. and running a cable approx. 45' to the radio.

What anntena would you experienced guys recommend? Any problems for a cable run of this length? I've seen where some have had trouble with performance due to improper cable and/or connectors. What cable/connectors would be best?

Thanks a lot for any advice you can share or references you can point to.

Nope, it's in the upper K band (24.5 GHz I believe). It's power out it sufficient to give you quite a bit of warning.

Message-ID: <329235ed.1140521@news.erols.com>
Source record: 217209
Cross-posted to: rec.radio.scanner,alt.radio.scanner

I have seen various references to CTCSS in my web searching, etc.

It has usually been in the context of:
"in order to eliminate receiving DES transmissions, set the CTCSS tone to 103.5 Hz. This only opens the reciever for 'in-the-clear transmissions."

I later saw an ad that stated:
"The BC 9000XLT has CTCSS capability with optional BC-005 CTCSS tone board."

I have a PRO-62 and PRO-2037. Is this something I need, or need to add or get modified? I saw no mention of CTCSS in the catalog or instructions.

Thanks

Source record: 217295

I had the same problem with a BC200XLT a couple of years ago. The BNC connector was slightly loose, and every time I changed antennas, the connector would flex or twist slightly. This eventually broke the connection between the antenna center conductor and the PB board. Also, the "ears", or two locking pins on the connector became badly worn, resulting in a loose antenna connection.

I sent the unit back to Uniden for repair. They replaced the connector with what appears to be a heavier-duty or better quality one. I've never had the problem again. No loose connection or pin wear.

Yes it is possible. You can get a cable at any electronic stores.
But recording voice on computer will take many megabytes on your
hard disk. You can setup your computer software to record voice
with the minimun sound quality. So you can setup, mono mode, and
with a 8khz sound instead of 33hz. Make somes tries and you will
see what setup will take less hard disk space!

Hope that's help you...

Source record: 217302

I also neglected to add that, if scanner listeners are interested in LISTENING to the shuttle, chances are your curiosity is such that you'd be interested in following the countdown events as they happen.

At the URL in my signature, I have pointers to David Ransom's JPLClock program, which can show up to 60 events with countdown timers for each event in the countdown. I've personally created a couple of Mission Timer Data files (MTD's) to go along with the program. Just run the program, plug in these timer files, and watch the shuttle countdown while you listen to the audio. Pretty neat stuff!

Just scroll down to the "Shuttle-related" section and you'll see the JPL-Clock program, as well as Dave's companion program, STSOrbit-Plus, used for actually tracking the shuttle (and other satellites, designed to look like the actual tracking wall map at the old MCC in Houston).

Get involved! And have fun! :)

>PS- What is triple-"up" conversion??
>
I recently got rid of my double conversion and got a new triple conversion.
The biggest difference I found was that cell phones were not running all over
the 800MHz frequncies. This was a real problem since the police in my area
use a 800MHz system. It was definately worth the upgrade.

> later.....

You can't, since there's too little atmosphere up there for you to hear
the shuttle. <wink>

Okay, okay. So even Milton Berle was better at jokes than me!
(Bah-DUM-bum!)

Well, chances are you'll never be able to hear things like the EVAs
direct without a large home-made dish or something, since they are
extremely low power; BUT...

If you have a tuner capable of recieving the following HF ham-radio
frequencies, you should be able to hear live rebroadcasts of the shuttle
air-to-ground audio, rebroadcast from Goddard Amateur Radio Club's WA3NAN
club station. Should one band die during certain portions of the day,
you'll be able to try the next few:

3.860 MHz
7.185 MHz
14.295 MHz
21.395 MHz
28.650 MHz

I couldn't find that list of local area VHF freqs (ham repeaters in the
2-meter and 440 MHz bands) on-hand, but maybe someone else here in this
group can forward a copy to the newsgroup(s), as I'm sure a number of us
would like to know what the latest version of that list contains anyway.
I've tried locating it on the web, but had no immediate luck.

Alternately, there are the following two URLs that I found which you might
also be interested in:

http://garc.gsfc.nasa.gov/www/retransmission/shuttle_faq.html
and
http://sd-www.jsc.nasa.gov/shuttle/comm/overview.html

And then again, if you have a satellite TV setup, you can recieve
NASA-Select TV, 24 hours a day. To get it, tune to the GTE Spacenet 2
satellite, transponder 5, at 3880 MHz, satellite position 69 degrees West
Long., with audio at 6.8 MHz.

Good luck!

Inside the lightbar there is a transmitter that sends out a signal, like a radar gun. This signal is on a different frequency than radar. This signal is being called "safety radar". The plan is to use this safety radar on fire trucks, Highway maintenance trucks, trains, etc... to alert drivers with the new radar detectors that can detect the safety radar that there is possibly a driving hazard ahead.

Hope this helps.
J. LeBlanc

Whelan signal corporation offers a rader band transmitter as an option
for emergency vehicles. The idea is that it will alert drivers with
radar detectors, making them look around for the cop car and see the
approaching COP/FIRE/EMS vehicle. I have only seen this in the catalog,
not on any emergency vehicle. There may be others with the same
technology though. Larry...

Gee. I don't suppose bass-ackward states like Virginia will be buying
these since they ban the possesion of radar detectors in cars. Dummies!

Unless 1000 channels and alpha is THAT important, I'd suggest the RELM HS-200. 200 Channels, 24-956, PL & DPL. That will cut down on intermod incredibly... True, it doesn't do SW, but the money you'll save (200 is about $290) you can buy a decent stand alone SW receiver.. =)

No problemo! Glad I could help someone. Unfortunately, my PRO-43
is a new one without cellular coverage, so I had nothing to lose anyway.
But, my 43 is modifidied internally quite a bit to interface it to the CE-232
PC->scanner interface. So Radio Shack repair probably would have had
a cow if they opened it up to repair it!

>Anyone used one of the Watson line of antennas?

Yup, I have a Watson, Radio Shack, and about 4 or 5 others that I've tried on the AR8000. After seeing constant talk on the net about using the Diamond 77CA antenna on the AR8000, I broke down and bought one just the other day and _YES_, everything said about them is true, it is the best antenna for full wide-band reception on the AR8000. I've tested it with low shortwave signals, CB, cordless, business bands, 800mhz and it _easily_ outperforms all my other antennas, including telescopic. I didn't think it could make a difference and figure the differences between the various ones would be minute at best, but I was amazed.

Downsides: it's tall, like about 18" or so, and was like $35, so it's not the cheapest, but damn it's good. Don't waste your time, take my word for it. If you want something portable, this is the best.

Edward the hlical works best of all. The polarization of the signals on
the
UHF milsat downlinks is circular polarized (right hand if I remember
right).
When ran some basic plans in the second issue of ST for a helical if I
remember right.

Good Luck and all the UHF mil bandplans are now available on the Ute
World
home page at: http?www.grove.net/~larry?uteworld.html

Cheers.

Just my 2 cents worth .. UPS is also in my opinion not very dependable.

I recently had a shipment sent UPS AIR 2 day service .. which I might add arrived in 3 weeks. Not only that but there was a $60.00 "Customs Fee" charge. Needless to say I was not impressed.

I live in Edmonton Alberta which is not a rural location so I cannot see why UPS provides such poor service.

Even the mail service is faster ... and alot cheaper.

All I can say is 1-800-GO-FEDEX.

Is Darlene wearing ? make up?

It's been awhile since I hunted in San Fran for breaking
news....but from a sf cop i got the following system
breakdown for you.....

AS I said before, those numbers refer to sections of the
police in a generic way....

So "1 Car" refers to Administrative Bureau....such as
chief of police, his deputies, King Willie, Internal
Affairs, TAsk Forces, Wants and Warrants, etc.

So "3 Car" refers to: Field Operations Bureau
such as: Central Station or Park or Ingleside or ?
Op Center ; Canine Unit; Housing Units; Explosives
Detail...etc. Richmond Station too....Patrol Division
TAsk force....TAC units, etc. Anything in the field.

So "2 Car" refers to: Support Services Bureau
such as: CID, Property, motor vehicles, records, photo
TSB bureau, RAT coordinator, Housing Police Staff.

So "4 Car" refers to: Traffic Company
such: traffic details and training

So "5 Car" refers to: Investigation Division
such as: Personal Crimes, Auto Theft, Burglary
and Robbery, Fraud and stuff like Crimes Against
King Willie, Narc, etc.

That is it.....call SCanners Unlimited in San Carlos on
Laurel Street and ask for Glen and ask Glen to send
you a San Francisco Freq book by Mobile Radio Resources.

Tell him I sent y ou....

Bill Conduit
etc. guy

>This sounds awfully cheap to me. I thought Grove or someone was offering
>to do this mod for somewhere around $200. What about the warranty on the
>radio, did they promise the warranty would not be voided?

Warranty was nearly gone and I felt confident that it wasn't going to DOA
on me due, but I'm sure it probably voids the warranty. I tried the
external speaker trick mentioned earlier thinking that maybe the audio was
just killing the speaker output (since it was worse on strong signals) and
it still had the same problem.

...and I knew the AR pretty well and have a pretty fine ear and would have
noticed if it came at the expense of selectivity, but I can't see to find
any problems. I dare say that it fixed the problem 99%, more than enough
for just about anyone.

There is no standard repeater offset for 150-160 region (frequency pairs used for ship-to-shore telephone or IMTS telephone are an exception to this). In many areas of the country, just finding two available frequencies in this band is a problem. All business category operations are simplex only.

>Si B.

It isn't all that mysterious. The manual claims that the memory will
remain stored for UP TO two weeks when no DC power is applied. The
scanner could probably be upgraded with a lithium battery circuit to
allow it to store memory indefinitely, but isn't it easier just to
plug it in to 12 volts from time to time? What good is owning the
scanner in the first place if you aren't ever listening to it?

This was designed as a mobile scanner, and the intention was to have
it hooked to a 12 volt source on a regular enough basis to keep things
alive. It is doing what it was designed to do. Most people (myself
included) just power it from a wall-wart all the time and that keeps
it alive. That is much easier than redesigning and modifying the
instrument.

Hello,

Try to track now the frequencies for "The Northern Central Railroad"
for a friend. Here is the info he knows about the railroad.

Info below

They are indeed in Pennsylvania, New Freedom to be more specific. The
Northern Central <history lesson alert> originally ran from Baltimore to
Canada, passing through York, Enola, Elmira, Pa etc. It was taken over
by the Pennsylvania Railroad, and portions are still in operation as
part of Conrail. The section from York to the Maryland line was pretty
much wiped out in 1972 (remember hurricane Agnes?) and was rebuilt with
government money. The Stewartstown Railroad was operating on it, but
then backed out of their agreement. The line now has a dinner train
operation on it, and there is a bike/hike trail being developed along
side of it. They may not be listen under Northern Central Railway, but
possibly under another corporate name. May not even be in the railroad
license area either. But, anything you can come up with would be nice.

Any possible frequencies please email them to me.

Steve

4455. The UPS COD Saga Continues.....

Newsgroup: rec.radio.scanner
Date: 1996-11-20 00:00:00 UTC
From: dconti@carroll.com
Message-ID: <E15LAw.Du8@news2.new-york.net>
Source record: 217125
Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.swap

Well, since my past postings on this matter caused so much debate, I decided to continue posting the progress or lack thereof on this matter to its conclusion....

Yesterday, Monday, 11/18 concluded 10 business days since the COD Trace was initiated by UPS. Still no check.

Based on the recommendation of some folks here, I called the 800 number, spoke to a Supervisor, and requested that a "national complaint" be filed on this matter. This would supposedly get some type of action or response within 24 hours.

Well, 24 hours later...nothing, not even a phone call.

Despite what others here might think, I do not think a dialogue of this type is flaming, but extremely important info for those here who do business with COD, and MUST know the best way to conduct this type of shipping.

The saga continues as we approach the date when it will be ONE MONTH since the package was delivered.....

Many Great Items for Sale:

HF:
Kenwood TS-120s 80-10 M 100 Watts ssb/cw works great, $300
Diawa 500watt AUTO antenna tuner. Works with ANY HF RIG. Cross needle meters. works great!!! $250

Scanners:
AOR AR-2500 Base/Mobile Scanner (used only as base)
2016 Channels
.5-1500Mhz NO GAPS
NFM, WFM, AM, BFO for SSB
Built in rs-232 connector for computer control
completely computer control-able
Software driven "spectrum display"
includes all software, cables, bracket and 2 manuals
Works great, Excellent condition
$350 FIRM

RS Pro-23
50 Channels
covers standard bands + cell Blocked 800 MHX
Great shape
$100

2M All Mode
Kenwood TS-700S 2M All Mode
FM,AM,SSB,CW
10 Watts output
Base/mobile, Has built in AC supply

Very nice radio
$350

Please contact me at hotfoot@dakotacom.net

4463. AR8000 serial link question

Newsgroup: rec.radio.scanner
Date: 1996-11-20 00:00:00 UTC
From: slwork@netcom.com
Message-ID: <slworkE15wrs.CwE@netcom.com>
Source record: 217133

I have some questions about the serial link on the AR8000. I saw someone who described a mod where you install a single 2.5mm jack on the radio which connects to the radio's receive data line. You can also build a simple RS232 to TTL converter with 2 resistors and a zener diode which can converte the 232-level signals from computer to the TTL which the radio wants.

With this setup, you can only send data from the computer to the radio, not the other way. Suppose you were running ScanStar on the computer would this work, or would the operation of the program be crippled by the inability of the radio to talk back to the computer.

What about the Scout, does it only send data to the radio and would it work with a single jack like this?

If you want a two-way interface are you required to install two jacks on the radio?

Try this out. Hope it helps.
-=[JimK Davis]=-
jimkd@worldnet.att.net

For restoration purposes there are two versions of the Pro-46:

1. Mfg after 5/94 can restore the test frequencies. Mine is marked
with a wite sticker on the back that says "5A4".

2. Mfg before 5/94 are fully restorable.

From: henniger@cisco.com (Mickey Henniger)
Newsgroups: rec.radio.scanner
Subject: PRO-46 New Mod - Simpler Mod for 'Unmodifiables'
Date: 12 Jan 95 08:44:28 GMT
Organization: cisco Systems
Lines: 221
Message-ID: <henniger.789900268@cisco.com>
NNTP-Posting-Host: nacho.cisco.com
Summary: PRO-46 New Mod - Simpler Mod for 'Unmodifiables'

I posted an earlier mod for the unmodifieable PRO-46's, but I have
found a simpler mod included below.

Mick Henniger

-------------------- Simpler PRO-46 Mod for Unmodifiables---------

It is not legal to listen to other people's telephone conversations with
radio and/or scanner equipment. This modification is provided for
information purposes only, not as an attempt to encourage people to
commit illegal acts. No warranty is offered, or should be implied.

There are two sections.

==========
SECTION 1: PRO-46 Mod for 'unmodifiable' version (mfg after 5/94):

==========
(notes and mild editing by jimkd@worldnet.att.net)

The old pro-46's could be modified for direct entry of any 800 megahertz frequency by removing one surface mount diode, and moving another.

Since then, the pro-46's internal computer has been modified to ignore the diode change, and the user was forced to use internal test modes in the radio in order to access the blocked 868.9375 to 896.1125 Mhz cellular band.

When Tandy found out that people were using the test modes (invoked by pressing certain keys while turning on the radio) they had several models of radios including the pro-46 shipped back to the factory to disable the test mode that allowed access to the cellular base-to-handset frequencies.

If you have one of these factory re-modified radios, you can still access cellular base-to-mobile frequencies by disabling the factory re-mod. This will enable the keyboard test mode again, allowing access to the blocked cellular band (868.9375-896.1125 Mhz), as well as one that includes TV, and land mobile. To disable the factory re-mod follow these steps:

1. Remove the battery pack, battery door and antenna.

2. Remove the four black screws from the back of the radio, then push upward on the bottom of the rear of the case, carefully swinging it upward and removing it.
(Note: release the two simple clip hooks at the bottom (bat case) to get it started).

3. Carefully insert a small screwdriver between the two boards next to the interconnect plug in the lower right corner. Gently pry the top board up to separate it and set it aside.
(Note: this was not necessary as the two boards are connected to the two halves of the unit and come apart when the case is split).

4. Unsolder the copper-coated plastic shield from the microprocessor and set it aside. ** CAUTION!! Too much heat will damage the shield. **
(Note: there is a shield on both boards. You want the one on the board attached to the front of the case. It is only necessary to unsolder the the top two points of attachment to access what you need).

5. Locate the newly attached rework daughterboard adhered to the board above the microcontroller chip. The daughterboard has five wires coming from it, four across the bottom, and one on the right of the daughterboard (Fig.1).

6. Find the third wire from the left on the daughterboard, (this is usually a brown wire) and clip it.

7. Reverse steps 1-4 to reassemble the radio.

8. Perform the Keyboard Test Mode mod as described in SECTION 2.

The daughterboard is about one inch wide and 1/4 of an inch tall. It
probably has a piece of black shock tape over it. There are four wires coming
out of the bottom (Grey,Blue,Brown,Orange) and one on the right (purple).
It looks like this:

The rework disable mod is known to work on the following pro-46:

serial number: 450330xxx
model number 20-305
Fcc-id-AAO20-305A
and a white label that says merely: 5A4

(Note: my serial # is in the 45029xxx range)

==========
SECTION 2: Keyboard Test Mode mod
==========

From: dbarton@moe.cc.emory.edu ( ),
editing by jimkd@worldnet.att.net.

This will restore access to two previously blocked bands: 868.9375-896.1125 MHz (cellular) with straight 30 kHz steps, and 54-108 MHz.

All standard disclaimers apply, including but not limited to the following: It is not legal to listen to other people's telephone conversations with radio and/or scanner equipment. This modification is provided for information purposes only, not as an attempt to encourage people to commit illegal acts. No warranty is offered, or should be implied.

PRO-46 TOUCHPAD MOD

1. Turn off the power.
2. While holding down the 2, 9, and L/Out keys, turn the power back on.

This will clear the units memory (you wrote the freqs down that you wanted to save didn't you--I knew you did) and load test freqs into the first 25 channels (I guess these are used to test the unit before it goes into the box). All but four of these freqs are within the units standard range.

The new freqs are:

Chan	freq	band
14	66.450	54-108 TV
15	76.825	54-108 land mobile
16	87.425	54-108 TV
23	888.96	868.9375-896.1125 cellular

HOW TO USE:

1. Direct search (p20 Owner's Man).
2. Freqs `captured' normally with the monitor button while scanning with direct search can be moved to a memory channel (p21 Owner's Man).

So, when you turned it back on holding down the 2, 9, and L/OUT keys it started scanning the 25 test freqs stored in the first three channel-storage-banks. To select one of these 25 test freq channels turn the squelch up until the static comes on and the display freezes on a freq.

Use the SCAN key to step through the freqs until you come to channel 23 888.96. Press the MANUAL key, turn the squelch off, then an arrow key and it will begin scanning.

Have a nice time.

Limitations: These freqs...

1. cannot be used for manual programming (p16 Owner's Man).
2. cannot be used in a limit search (p18 Owner's Man).

Permission is hereby granted to copy, transmit, archive, or send this file by any medium as long as it is reproduced in its entirety. Many thanks to those who submitted the info originally (sorry I lost the names).

==========
Modification of older (mfg before 5/94) model pro-46 by moving surface mount jumpers.
==========
Product: Realistic PRO-46 by Radio Shack
Purpose: Restoration of full 800 Mhz coverage

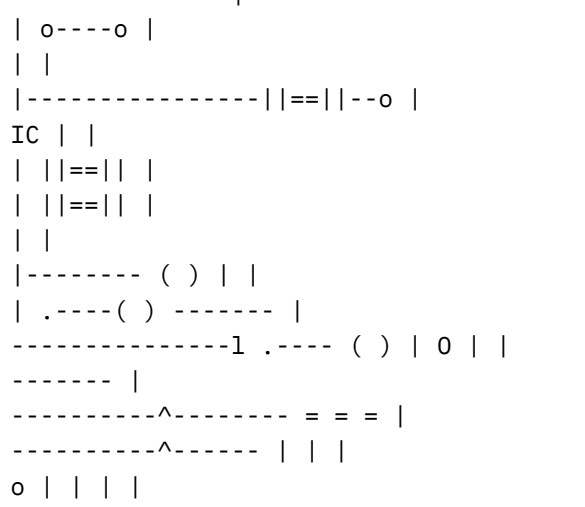
The modification of this unit is from the May, 1993 issue of Monitoring Times, published by Grove Enterprises.

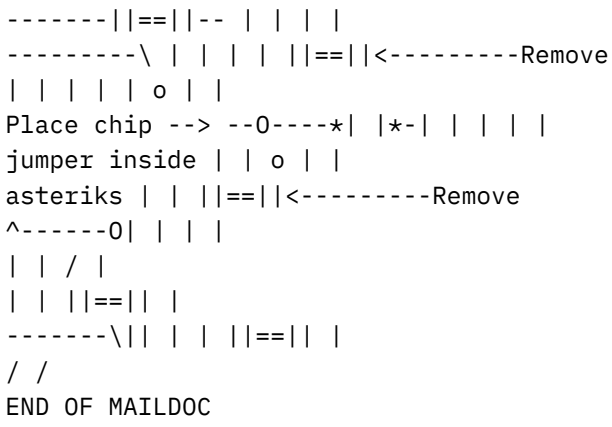
** Disclaimer: All modifications are done at your own risk. This product uses surface mount components which can be easily damaged. Do not perform this modification if you are not experienced with this type of circuitry. This will void the warranty of your scanner.

** Listening to certain portions of the 800 Mhz band is prohibitted by United States law.

Modification of PRO-46 for full 800 Mhz coverage with 30 Khz stepping available.

1. Remove the battery pack, battery door and antenna.
2. Remove the four black screws from the back of the radio, then push upward on the bottom of the rear of the case, carefully swinging it upward and removing it.
3. Carefully insert a small screwdriver between the two boards next to the interconnect plug in the lower right corner. Gently pry the top board up to separate it and set it aside.
4. Unsolder the copper-coated plastic shield from the microprocessor and set it aside. ** CAUTION!! Too much heat will damage the shield. **
5. Locate the two chip jumpers imprinted with "0". Carefully unsolder and remove both.
6. Solder one chip jumper across the two upper most unused solder pads. (Soldering a jumper across the lower two pads changes the 30-50 Mhz band to 68-88 Mhz.)
7. Reverse steps 1-4. The modification is completed.





END OF MAILDOC

4467. Re: blocked channels on PRO-62?

Newsgroup: rec.radio.scanner
Date: 1996-11-20 00:00:00 UTC
From: Rich Wells <rjwells@vnet.ibm.com>
Message-ID: <3292FDE2.446B@vnet.ibm.com>
Source record: 217137

The frequency is not block, the CPU is simply rounding off the
entered frequency to a whole multiple of 5kHz. The frequency
you tried to enter was centered around a multiple of 12.5kHz.
Since the RS models don't allow user-setting of the step
size(or a large variation like the AOR or Yupi models), you
just have to take what it gives you.

Don't worry though; you'll still be able to hear the transmissions
on the .4625 even though the scanner is tuned to .4600 due to
selectivity bandwidth on either side of the tuned frequency.

John,
IMHO you'd be better off staying away from the 2700. It has
TERRIBLE squelch control which, by itself, is reason enough not
to purchase this scanner. Add to that too much internally
generated noise and intermod and you can begin to figure out
why this scanner wasn't on the market too long before it was
"put out to pasture".
Do yourself a favor and get a BC3000 or Pro-26/60.

Strong signals,
Rich Wells

Richard,
Thanks for the comments on the WS. Glad to hear you like it. I was
awful tempted to get one when they first came out but thought I'd wait
a little and see what the consensus was from actual users.
Would it be possible for you to post more on this scanner with
respect to features, specs and usage compared to any other scanners
you might own as far as pros and cons for sensitivity, intermod,
audio quality. Any info would be appreciated! Thanks!
In the meantime, I'll be chomping at the bit waiting for the
new Yupiteru MVT-9000 to hit the shelves...I'm definitely gonna
be one of the "first kids on the block" to get this radio!

What dilemma? Or is this another solution desperately searching
for a problem?

> New computer technology developed for the military is
> what this localized version is going to be canabalized
> from....look what the military can do with speaking to
> command units in Saudi Arabia from the USA by using the
> link between them....satellite.

Look at what Peter Arnett was able to do speaking via an InMarSat
phone from downtown Baghdad during Desert Storm, putting aside
the fact that it costs something like US$15 / minute.

Besides, the military is a monolithic entity with standardized
training and procedures. This is not the case in police work.

For starters, they use different abbreviations and have widely
varying communications infrastructures with different operating
procedures. There is no comparison between an Army communications
technician trained specifically to use the satellite equipment and
myriad police officers linking their police radios to a satellite system
every once in a great while and actually getting something communicated.

Ain't gonna happen!

> What's really ominous is that someone in Washington can be
> the pushee of the buttons that enables a robot plane to take

Yeah, it's run by computer so it can't fail. I forgot about that detail.

What's the next grocery-store-tabloid headline for us to discuss?

4475. New version semasoft

Newsgroup: rec.radio.scanner
Date: 1996-11-20 00:00:00 UTC
From: Rene Hagen <hagenr@involve.nl>
Message-ID: <01bbd6be$5f3ec4a0$2880099a@vianen1.involve.nl>
Source record: 217145
Cross-posted to: alt.radio.scanner,rec.radio.scanner

From now on all new version of semasoft are available at the simtel archives. I will post the upload announcements in this newsgroup. So here is the first one :

I have uploaded to Simtel.Net:

http://www.simtel.net/pub/simtelnet/win95/ham/sema114.zip
ftp://ftp.simtel.net/pub/simtelnet/win95/ham/sema114.zip 117276 bytes

sema114.zip Decodes pocsag signals from your scanner

This program will decode pocsag audio signals from a scanner connected to your soundcard. Pocsag is a standard for pager messages. This is version 1.14.

Special requirements: None.

Changes: Improved bitdecoder.

Freeware. Uploaded by the author.

Rene Hagen
hagenr@involve.nl

4476. Modifying a cassette palyer for 15/16 ISP

Newsgroup: rec.radio.scanner
Date: 1996-11-20 00:00:00 UTC
From: brueger@widomaker.com
Message-ID: <32931468.618743@news.widomaker.com>
Source record: 217146

My son has a learning disability and thus is allowed to use the Library of Congress Audio Books on Tape collection. The local library has supplied him with a tape player, but it is very bulky. It also does not take any kind of expendable battery - the internal battery is rechargeable but permanent.

Recently, while check out some new tapes for my son at the library, I stumbled upon some catalogs ï¿½specializing in products for the visually & hearing impaired.ï¿½ In these catalogs are several different models of cassette player/recorders for playing the Library of Congress audio tapes. Annotated in the description of these players is the statement that they are ï¿½modifiedï¿½ versions of regularly obtainable major brand cassette player/recorders. I e-mailed one of the companies asking a question above a VOX model and in their reply they implied that their company modified these units rather than the manufacturer.

Well, I got to thinking, why canï¿½t I just modify one of my existing cassette tape players? This canï¿½t be all that hard for someone who knows their way around a soldering pencil.

Does anyone have any info on modifying a 1 7/8 IPS player to play 15/16 IPS tapes???

Thanks

Brian

I am interested in any experiences you have had with the Optoelectronics
APS 104 preselector.
What equipment did you use it with?
Did it perform as claimed?
Was it worth the money?
Any other choices you could recommend.

Does any body want to sell one.
(I responded to a email last week offering to sell one, but no answer.)

15/16? Is that 15/16" per second tape speed?

In any case, a lot of the recent tape players I've played with
(especially walkman type, but also desktop models) use a feedback
circuit to set the speed of the motor transporting the tape. Usually
there is a trim pot on a circuit board near where the motor leads are
connected to. Sometimes there is a separate PC board mounted near the
motor with the trimpot for adjusting the speed. There is probably
enough adjustment in this pot to reduce the speed to what you need.
If not, play around with the resistors on that section until you get
the desired results.

Hey Anthony....how short would YOUR fuse be if YOU had to endure this
lunacy, and wait this long for YOUR money?

I only mentioned 24 hours because those folks recommending the "national complaint" route stated that this usualyy brings a response within 24 hours.

Remember, we're not dealing with 24 hours, here.....it's been almost a month since the package was shipped without any action, a phone call...NOTHING!

Pay attention and read the thread before you post......

I wouldn't call expecting 24 hour service (when it is advertised) being
"short fused." Now, if they had said "We'll call you back in a few
days," then maybe, but when a business advertises 24 hour turn around, it
is not unreasonable to expect such...

Nick,
For your price range, the best bang for your buck would be a
Uniden BC3000-XLT or a Radio Shack Pro-26(which is also made by
Uniden). Each of these can be had for $350 or less delivered.
For the Uniden, you might try Commmunications Electronics in
Michigan; for the Radio Shack, Pioneer Data in Oregon.
Good luck!

The Sportscat as with most 800mhz scanner only block a small portion
on the 800mhz band around 830 to 860 or so.(Not exact) most cell is in
that area in large cities. In smaller towns like mine most cell is 870
to 915 so you get to listen in. Neat huh?

From: Rich Wells <rjwells@vnet.ibm.com>
Message-ID: <32934034.167E@vnet.ibm.com>
Source record: 217164

I think the PerCon CD is a good value at $30 but I would not call it
a great value simply because the interface is not very friendly or
flexible. Suffice it to say I was not pleased with its features
after installing it.

It gets kind of tiring for every search to have to select the state
I want to search in. There is no method(that I've found) to search
by multiple counties, cities, etc. I live near the boundary of
three counties and it is a real pain to do the same search three
times but with a different county to get what I want.

I previously used the Grove FCC database whose search options were
"infinitely" more flexible and usable than PerCon. And once you had
a screen full of results, you could print it out or revise the search.
Not so with PerCon, if you send the results to a screen and then want
them sent to the printer, you have to perform the search over again
from scratch and select the printer as the output.

I' think for '97 I'll be going back to Grove...it may cost a little
more and provide a little less but at least I can get the data I need
(the real reason for the existence of such a program) without having
to do multiple searches for each desired query.

'Nuf said. I'll shut up now...

Strong signals,
Rich Wells

>I do not want to compromise my HF monitoring...
>Any comments ?

I tested both an ICOM R8500 and AOR AR5000 for Monitoring Times
magazine. The AR5000 review will be published in the December 1996
issue, due out next week.

The R8500 review will appear in the January 1997 issue.

Both radios work well. Neither of the units I tested are "dogs."
They are noteworthy exceptions to the heuristic that "receivers
which cover both shortwave and VHF/UHF are usually poor performers
in at least one domain."

The AR5000 is more flexible and has more features than the R8500
for VHF/UHF, but I found the R8500 easier to use and better built,
so I bought one -- mainly for VHF/UHF use.

The R8500 performs very respectably below 30 MHz, too.
It includes a noise blanker, missing from the AR5000.

I prefer the JRC NRD-535D for shortwave listening under
severe conditions because it has variable bandwidth,
passband tuning (instead of IF shift), and an IF notch.

The R8500 has alpha labels, many more channels than the NRD535D,
and a flexible bank arrangement. Lately, I've been controlling
and downloading frequencies into the NRD535D using the freeware
NRD program. The radios are located in the basement and the
computer is on the ground floor. One of my converted baby monitor
repeaters rebroadcasts around the house (on 49 MHz) whatever the
NRD hears.

It's frustrating to have a collection of high-end SWL
radios when the propagation is poor :-(

BTW, reprints of articles from Monitoring Times are available
for $2.00 each plus a self-addressed stamped envelope from:

Grove Enterprises, 300 S. Highway 64 West, Brasstown,
NC 28902. For a free catalog, call (704)837-9200.
Telephone (orders only): (800)438-8155.

I don't get any part of the $2.00.

I tried the low end Opto. It works but i need to be about 5 feet away
from a cell phone. I am looking into the Opto APS104 preselector-it is
supposed to extend the range conciderable.

It has a lot of featurs for the close-out price of $200. But it has
some limitations with the squelch, sensitivity, and succeptibility to
noise. If you want to monitor weak signals, I'd stay away.

The RS frequency counter I own does not compare to Opto's. It's good for close-in counting, but otherwise it tends to count everything in sight. You'll likely have to place the counter's telescoping antenna within inches of the source to determine the transmission frequency. I think that rules out "sleuthing."

> I have looked and looked to no avail. Thanks alot!

No surprise to me.

I have been through the great state of North Carolina while traveling
many times and they don't say a whole lot. At least I haven't heard
a whole lot that meant anything. Mostly a ton of transmissions from
a male dispatcher on 42.50 saying "gweeeeeed", his way of saying
"go ahead", and "tayur" for "10-4".

The only other time I heard genuine police activity was when I
was heading north on I-95 north of Dunn, N.C. and several troopers
were trying to locate some car for something, perhaps a robbery
suspect fleeing on the interstate. They talked a lot car-to-car,
the first time I had ever heard such activity. It was so surprising
to me that I took the opportunity to get gasoline early and listen
to the traffic in peace and quiet for a few minutes instead of driving.
Before and since I just don't really hear much from them when
passing through.

What I do know: they use 2-frequency simplex, so you hear the base
station on one frequency and the mobiles on another. Unless, of course,
the mobiles are talking car-to-car, when they use straight simplex.

They are on low band between 42.50 and 42.86 or something like that.
Ho boy! You're in luck because I just pulled out my handy dandy
I-95 scanner list for state patrols.

155.445 hand held extenders (vehicular repeaters--most important!)

42.70 F9 mobile
42.50 F9 base

42.80 F3 mobile
42.52 F3 base

42.66 F5 mobile
42.60 F5 base

42.78 F1 mobile
42.62 F1 base

42.76 F7 mobile
42.64 F7 base

42.66 F6 car-car (same as F5, notice)

42.86 F11 mobile
42.82 F11 base

42.84 F12 state-wide

Note 1: The above list is from an old, old dBase file a friend downloaded from
some bbs back before the World Wide Web even rearched across DARPA's basement. :) I cannot vouch for the currency of it, but I have heard activity on some of these frequencies as recently as this past Summer of 1996.
It also lists several high band frequencies, but I never heard anything besides paging interference, so I don't think they use these; they just have the F.C.C. allocation and that's why they are on this guy's list.

Note 2: That PAC-RT frequency listed as hand held extenders is extremely important for you highway travelers. If you hear 2-way radio activity on this channel, then you are within about 1 mile of a highway patrol unit. The meaning of this is left as an exercise to the driver.

Anybody with corrections or updates, please feel free to do so.
I am as interested as the original correspondents.

Thanx!

And one more and bend left and one.... Some people just have too much time on their hands...

Well have you tried some of the other bands? Like 49.8450,49,8600,49.8750 and 49.8900 which a good number of headset wireless sets use. Otherwise they can be all over the spectrum as LPU (low power units). Some frequencies that wireless mikes can be on are
35.9800
36.7000
154.6000
170.1500
170.2250
173.4300
174.0000
174.2700
178.2100
180.0000
180.6000
186.0000
192.0000
198.0000
204.0000
210.0000

There may also be some UHF units and some 900 Mhz units out there. These all will be low power, so you probably won't hear them all that far 100' to 500' maybe. But seeing how they are in constant use you may have to either get a frequency counter, or just search to whole spectrum...

Ken, I believe you meant 460, typo i'm sure, but you might be interested to know that the auto-theft detail and other undercover and survelliance things can be heard in the 70mhz range. Specific frequencies aren't available, as they change constantly, and are usually simplex or thru a mobile repeater.

So, are you saying that cops can't figure out how to run a satellite system? You mean the same group of people who got all screwed up when they put ABS in the Caprices? Something tells me we'd see cell phones in every car before satellite trunked systems. Just a perspective from the "inside."

Sure will,
but let me get the manual,
so I can go through the features in an organized manner.

I'll tell you this...
Whoever said a problem with this scanner is the inability to lockout
freqs in a scan bank is drawback is 100% correct. I have no other
real complaints.... well audio is low, but what do I expect on
2 AA, in a 1/2 pack of smokes size scanner....

Posting of info will follow next week.........

If it is anything like the Standard C508A dual band handheld, it is well worth the money. The C508A has excellent coverage of the 800 Mhz band, as well as VHF-Hi and UHF (aircraft too!). The audio is understandably low. A good tip: The C508A uses two "AA" batteries also. Go to Wal-Mart or Radio Shack and get the Energizer "AA" lithium batteries. A bit more expensive ($4.88/pair) at Wal-Mart, but they last QUITE a long time!

4536. CTCSS

Newsgroup: rec.radio.scanner
Date: 1996-11-21 00:00:00 UTC
From: cliffj@erols.com
Message-ID: <3293bc13.1059974@news.erols.com>
Source record: 217032

I have seen various references to CTCSS in my web searching, etc.

It has usually been in the context of:
"in order to eliminate receiving DES transmissions, set the CTCSS tone to 103.5 Hz. This only opens the reciever for 'in-the-clear transmissions."

I later saw an ad that stated:
"The BC 9000XLT has CTCSS capability with optional BC-005 CTCSS tone board."

I have a PRO-62 and PRO-2037. Is this something I need, or need to add or get modified? I saw no mention of CTCSS in the catalog or instructions.

Thanks

Actually, a triple-conversion scanner only means that it'll be
more resistant to image reception. In other words, it's very likely that
you will not be able to pick up cell images at all. =(

The form of conversion only determines how well the scanner
"rejects" images. It doesn't determine the how far off any images
deviate. (Deviation is determined by the scanner Intermediate frequency).

I've had one for a little over a week. You know it's on sale for $250 through Saturday, right?

From what I've seen and heard so far, this little puppy performs quite well. I don't have anything to compare it to, however, so not sure how it fares with other comparable handhelds. Short of the PRO-26 and Uniden 3000, I think it's the best thing going (don't care much for the AOR stuff. YMMV). The PRO-26 has several nice features the 60 doesn't have, but IMO it's not worth the additional $110 (the 26 is also on sale right now for $360). Now if the 26 were to go on sale for, say, $299, I'd buy it in a heartbeat. Actually, I'm hoping they'll do this in the next 3 weeks or so. I'll take back the 60 and trade it on the 26. But, if it's not to be, I'll be quite happy with the 60.

Source record: 217038

Wonderful scanner...especially when you consider that they're on
sale at RS for $200. This scanner is the successor to the Pro-43.
It is practically identical in size, features and sensitivity.

The new Direct feature is almost like having a VFO...punch in the
frequency, press Direct and listen...use the up/down keys to
step through frequencies.

Another new feature allows the Manual button to step forward or
backward through the memory channels.

The LCD is a tad bigger but still borders on "kinda small". The
backlight is green and JUST BARELY adequate.

I do not like how they changed the Search feature. To start
or resume a limit search, you have to press AND HOLD DOWN an
arrow key until it begins searching again. This is because
they allow a single arrow keypress to step through frequencies
one step size at a time. Kind of a pain in the backside when
you're used to a single press of an arrow or SRCH key.

The Pro-60 is still a power hog since it uses 6 AAs...this
should be no surprise since it is basically a Pro-43.

Overall its a very worthy successor to the Pro-43 and a steal
at $200!

Strong signals,
Rich Wells

I checked it out and this is what they're selling (yawn).

Radios-Scanners
Item 34545

Reason for Salvage: Theft Recovery - Stolen-Recovered
Location: Seattle
Inspection Available
Midland

2) #70-0371A
(1) #0375C
(1) #0371C
(1) #1695B
(2) #0355C
(1) #1330B
(2) Bearcat 700A Scanners
(2) Mort Hand Radios GP-300
(2) Mort CB/VHF 6 Channel
(1) Mort SP 50

Merchandise is NEW in unopened boxes - Originally stolen from a retail
outlet
and recovered by local police department. Property of the Insuring
Company.
Best offer by November 28, 1996 or Negotiated sale.
Must bid "All"

The BC2500 (a triple conversion unit), it still gets images. I think
the cells are up at 1270 or so.

I tried using an FM radio adaptor and found the freq constantly drifted
at the output of the adaptor, requiring constant tuning of your car's
receiver.
What works MUCH better is a car cassette adaptor, with consists of an
empty cassette housing with a reversed polarized head installed and has a
thin wire coming out to be plugged into the ear output of the scanner (or
port CD player.) This has worked quite well for me, no prob at all. Of
course, if your car stereo has no cassette, your options are limited to
the FM device.

>know of it. Thanks

I have it and it works well except that the foxpro data base front end
is a bit limited.
The data base itself is (bunches) of megs but its only one file which
is part of why things take so long. The second reason it is slow has
to do with the fact that the data is on CD-rom and therefore slow.
Heres how I sped mine up.
I put the CD in, used microsoft access and 'extracted' the data for
maryland (where I live). I saved the resulting 10MB file on my
harddrive using the same filename theat percon used for the origional
file.
I copied the program files off the CD onto my harddrive. Now I can run
it off the harddrive MUCH faster! (especially since it doesn't have
to search through 49 other states. I guess I could have made a bigger
file holding say the surrounding states as well but It wasn't n issue
for me.
You can use other database programs on the data and get around the
foxpro interface so that there's more versatility.
Considering that its complete, covers all 50 states, and not that much
more than buying police call, and beyond police call at RS so that you
have 80% of the listings for your area, I think its a good deal.

4547. Finding the repeater freq from input freq?

Newsgroup: rec.radio.scanner

From: douglas@netcom.com
Message-ID: <douglasE18H1C.GG9@netcom.com>
Source record: 217043
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Using my handy Optoelectronics Scout, I was able to snatch the input freq
from one of the guys in the parking garage. Ok, so it wasn't quite that
sneaky -- I went up to him and asked him to key it and I showed him how
the Scout could pick it up.

Anyway, I now have the input freq for a repeater (I know that they use one).
Is there any standard freq offset for repeaters or could it just be random?
Does regular business band stuff usually have a standard offset?

...if it could be anything, would it be safe to guess that the last few
digits would be the same? (ie: 156.225 input, 156.525 repeater?)

Any veterans out there have an idea?

Thanks!

>Is there any standard freq offset for repeaters or could it just be random?
>Does regular business band stuff usually have a standard offset?

VHF high and low have no standard repeater offset, except in the ham bands where the offset is 1 MHz on 10 meters (29 MHz) and 600 kHz or .6 MHz on 2 meters (146 MHz area).

UHF has two offsets, 3 and 5 MHz, depending on which subband. Hams use 5 MHz on the 70cm (440 MHz) band, as do commercial users on 450-454 and 460-464 MHz. They use 3 MHz in the "T-band" above 480 MHz.

800 MHz has a 45 MHz offset.

: phone-surfing, breakups, makeups, people in bizarre situations, etc.
: It's more entertaining than ANY TV program out there...even Rikki Lake.
: You'll never want to watch TV again.

probably the funniest thing i've heard so far was some dude
staying on a gay chat line for like an hour or so. absolutely
hilarious.

: a warning though...you'll hear an interesting conversation which with
: your luck, the call will switch cell sites. You'll then frantically tune
: up and down the band trying to find the rest of the conversation which
: you'll may or may not find again.

i hate this. you can usually scan down or up a few MHz or so
and find it again. from what i can tell, htough, it doesn't
necessarily have to be switching sites. can one cell swap
a caller's frequency in the middle of a call for security
reasons? it appears to me that this is what's happening most
of the time. i can listen to one call for a super long time,
having the freq change every minute or two.

What's this Diamond RH707? Just another rubber duckie/whip?

With extremely rare exceptions, handheld scanner antennas are just a straight length of conductor. The only significant difference between them is the length of the conductor. It always amazes me to see shops selling fairly expensive antennas that are, effectively, just a straight length of conductor!

And the comparisons ... "XYZ antenna is better than ABC antenna". All that matters (to the receiver) is the length, so most of the cheap telescoping whips are a far better bet than *any* rubber duck because the length can be varied. This makes the whip more flexible, and if you set it to the same length as a $40 rubber duck they will perform exactly the same.

I suspect that people think that you have to extend a whip all the way, which will of course favour lower frequencies. But if the whip is set to the same length as any expensive alternative, there will be no difference in performance at all. (Of course there may be differences in usability, an rigid telescoping antenna might not suit your requirements).

Price does not necessarily correlate with performance and value.

Daniel.

the 'good' rubber duck antennas are coiled, i.e. ones for ham radio, like
the Diamond RH-77CA which are designed for transmit where length does
make a difference. this is a dual band antenna too.

Hello Brian

We are in private email on another subject but I thought I would reply
in public incase it is of help to others as well.

My daughter is visually handicapped and has had special aids to help.
One of them was a cassette recorder that has variable speed control
system. I don't know if it will help you, or even if it is still
available. Here are the details on the machine.

REALISTIC brand. Type VSC-2000 Calalog No 14-1060A

The label on the back reads:-
Costum manufactured in Taiwan for TANDY CORPORATION

It looks and operates like any regular cassette recorder/player. Takes
standard cassettes and ordinary "C" batteries as well as ac input.

BUT also has a special variable speed/speech control.

The speed control allow you to slow down to 0.8 of normal and
infinately variable speed up to double normal speed.

In addition to this, there is a speech control that is independant to
the speed control: IE they can be set to seperate settings OR they can
track each other OR one or the other can be used on its own.

Speed control is obvious but the speech control actually process the
frequency of the speech so that if it is used for listening to text
from books, you can increase the speed to say 1.5 times normal and
then reduce the high pitch sound back to normal.

After a bit of practice, it is possible to run a 30 minute text in 15
minutes and still understand it.

Perhaps a call to Radio Shack or Tandy Corporation HQ will find out if
it is still available. It may only be available through stores or
institutions specialising in special products for the hadicapped
fraternity. If tandy still do it (or it's successor) they should be
able to point you in the right direction.

Failing that Brian, I could see if one is available over here and
"export" one to you. I cannot remember where we got ours from,
possibly the Instution for the Blind.

We have had ours for ten years (Believe it or not, Elizabeth never
used it & now I have it for recording "things")

She is all grown up now, gone through University and has BA (hons)!!

I wish you and you son well Brian, let me know if you want me to
research this side of the damp patch...

Source record: 217060

In the last few days, several people have launched BINARIES in this news group. one or two of them have had the courage to and grace to apologise for doing so.

More and more binaries are appearing and I fear that many people are taking it for granted that it is in order to do so.

I can, perhaps understand a person wanting to do it when it is possibly of global interest, but even then, not everyone wants to be inflicted with big files.

I can not understand how any one can imagine global interest in local frequencies (like a recent one giving an Australian city frequencies) and then inflict thousands of lines of a binary on everyone.

OK so I have had my gripe, lets hear a what YOU think about binaries.

Is it in order to post them here. or what would you advise potential binary posters to do to get their gems to potential recipients?

No flames, no bad laguage just your thoughts in a constructive way.

First they came for the hackers. But I never did anything
illegal with my computer, so I didn't speak up.
Then they came for the pornographers. But I thought there was
too much smut on the Internet anyway, so I didn't speak up.
Then they came for the anonymous remailers. But a lot of nasty
stuff gets sent from anon.penet.fi, so I didn't speak up.
Then they came for the encryption users. But I could never
figure out how to work PGP anyway, so I didn't speak up.
Then they came for me. And by that time there was no one left
to speak up.

>: conductor!

From experience I do not completely agree. I have several rubber duckies as well as the 46" Grove extendable whip. Especially getting up to 800 Mhz, the whip in collapsed position is not as sensitive as my dual band 8" long whip from my Yaesu FT530. I agree that the whip is, overall, most versatile, BUT... get real! - I would not want to run around with a stiff rod on the AR8000, which, if it hits a wall, car door, etc will either snap itself or worse, snap the AR8000 connector. The AR8000 is relatively fragile - that is why I always leave a whip attached.

4584. North Carolina Highway Patrol

Newsgroup: rec.radio.scanner
Date: 1996-11-21 00:00:00 UTC
From: CastleCothran@roxboro.net
Message-ID: <3294c4f7.9169310@News.vnet.net>
Source record: 217080

The North Carolina Highway Patrol uses around 20 low band frequencies to communicate with all patrol cars. There are several high band frequencies. In addition, computer displays are beginning to be used. Also, lots of the troupers have scanners, local police walkies, and cellular phones. Their cars are beginning to look like antenna farms. Each district a,b,c,d,e,f,g,h, is followed by up to 7 or 8 subdistricts, for instance C-7 would be the Durham-Oxford area. Each car has numbers assigned linking to these districts, for instance C-711 is a sargent in the Durham-Oxford area, so is C-722 and C723, regular patrol officers under these sargents start with numbers C-730 and upward. Example: The above district uses 42.66 car to base, 42.60 base to car and car to car. This is dispatched out of Raleigh. There are numerous other pairs used for other districts dispatched out of Raleigh. 42.80 and 42.52 being the other most used. Greensboro, likewise, uses several pairs for their operations, the most common being 42.78 and 42.62 for the piedmont area I monitor. Also, I monitor some of the point to point repeater sites that take the low band frequency and shoot it to Raleigh via UHF. The North Carolina State Patrol frequencies are the most exciting, most active, most professional use of police communications I have ever monitored. I have a Cushcraft low band commercial antenna 700 ft. MSL with UHF beam for point to point. I use several older crystal tuned receivers and can hear car to car, and car to base, direct 100 miles. In the 30 years I have had this as a hobby, I can truly say they are better than the tv show "Cops" on many, many days. Look for 10-43 (chase) numerous evenings in the spring, fall and summer, especially on full moon weekend evenings starting around 10:30 pm.

4585. BC3000 Baseband Audio

From: mikenet@access.usa.net
Message-ID: <573ffr$sg5@earth.usa.net>
Source record: 217081

I own a Uniden BC3000 scanner. I am looking for a reputable company or individual to modify it by installing a jack so I can get the baseband audio.

I have been playing around with some POCSAG software (PD.EXE) using the headphone jack. This does not work very well at all. The volume level needs to be changed constantly.

From what I have read I need the NFM baseband audio. I believe this comes from IC-202 pin 12. I have looked at the circuit board and I don't think I could get a wire attached to this pin. If there is another connection point please let me know. If you have this mod please let me know how well it works. If there are detailed instructions somewhere on doing this mod please point me to them.

Also, Is there any need to have a baseband audio ouput for WFM or AM?

Thanks.......Mike

>
> Bob.

I think there is some confusion here between _multiple path_ flutter,
or, call it what you will, and a peculiar characteristic of the squelch
circuit in the AR-8000.

1. The flutter described is typical for VHF and UHF signals where
indirect and direct signals interact to produce the effect of adding in
signal strength and subtracting from each other as a function of
relative motion between the transmitter site and the receiver site... or
sometimes due to the source of a reflected signal path changing.
A base station or terminal cell site, may pass on the audible effect of
flutter but it cannot pass on the variation in signal strength
associated with the perceived flutter... its signal strength will remain
constant except for external effects.

2. I have noticed the AR-8000 squelch window is suceptible to variations in deviation of the received signal.
Inconsistent deviation of cell sites is typical of our system down here. If the received signal deviation extends beyond expected limits of the _window_ set by the receiver filtering circuits the radio perceives this as a decrease in signal strength and may shut down the squelch gate as a result of this perception.

4595. McDonald's, Mod & The RCA

Newsgroup: rec.radio.scanner
Date: 1996-11-22 00:00:00 UTC
From: richard@co35pn.demon.co.uk
Message-ID: <3295c9a8.5412941@news.demon.co.uk>
Source record: 216918

Taken from my local paper Thursday 22nd November 1996

"MoD pulls plug on McDonald's radio"

A radio system used at a drive-in restaurant has been ordered off the air - after apparently interfering with military channels.

Staff at the McDonald's drive in restaurant did not have a nice day when the men from the ministry arrived to pull the plug on their new system.

The radio headsets were delivered to the fast-food outlet just a few weeks ago, but it is understood the Dutch manufacturer had not checked

whether they could cause interference with other British channels.

There were claims today that the radio sets had interfered with the military channels - and left puzzled soldiers from the Garrison getting orders for Big Macs and fries.

A spokesman for McDonald's today said restaurant staff had been shocked when ordered to stop using the radios, but stressed they have received

no complaints about the radio headsets from the Garrison.

"The Radio Communications Agency called in to see us on Tuesday and asked us to stop using a particular frequency for our radio, system so

we did," he added.

A spokesman for The Radio Communications Agency said "The equipment was unlicensed and operated on frequencies which interfered with other users."

I very highly doubt that calls swap cells merely to make them more difficult to listen to. The cellular switching system is overburdened enough as it is. Cell handoffs are done only because the location of the phone changes, or to balance the load between cells. Also, remember that cells are _very_ small in places like downtown Atlanta, your average car is not going to stay in the same cell for more than a minute. Every cell can handle 48 calls at the same time (actually most of them are divided into thirds which each handle 16 calls). Given the huge number of people with cellphones, each area has to be quite small.

And remember, why would the cell providers have a need to make calls change cells just for security. After all, the ECPA prohibits people from listening in.

Hey there,

I have both the original manual (which basically sucks) and one that a Jay Appell wrote like back in 1992 or so. It's available on the net although I had to do quite some tracking down to get the newest version. Despite how old it is, it's actually very well written. So well written that once released, Alinco started using THAT as their documentation.

Let me hunt it down on my local drive. I'll email it to ya.

>ear. Add to that we usually had a few on the speaker and the usual banter
>of CIC.

I knew I wasn't the only one who listened that way. .)

If you're still looking for ways to patch scanner into car audio:
Here's what I have done:

!! If you will be using car power for scanner (ie cig. lighter adapter)
make sure scanner is negative ground, esp. the earphone jack !!

I took an old earphone cable, ran it in back of car radio.
Hooked 20 ohm resistor between audio hot and ground (dummy load)
Ran audio thru .1 mfd capacitor, then thru 10k ohm resistor to center
connection on left section of car radio volume control.

Other variations are possible -- dual 10k resistors going to both
section for scanner audio from both channels for instance. Or
hooking audio into top connection of volume control.

You may have to experiment with the resistor values if volume levels
are out of whack. Start testing with volumes both turned way down.

Try playing I can't drive 55 (Sammy Hagar?) while listening to
a multiple car hi speed chase.

BOB PARNASS posts an EXCELLENT article every month here for you -

REPAIR TIPS: BEARCAT SCANNER RADIOS
Copyright 1993 - 1996 by Bob Parnass, AJ9S

Here's just a small portion of it. If you cannot locate it anywhere
else, send me a piece of EMail (sysop@atdbbs.com) and I will send a copy
to you via return EMail.

==========

Schematics, Owner's Manuals, and Parts Available

The re-incorporated Electra Corporation, (317)326-4419, is
able to effect repairs on some older (pre-Uniden) Bearcat
scanners. They sell crystals, antennas, power cords,
owner's manuals ($11 ea). Electra Corporation is located
at 251 N. 300 W. Greenfield, IN 46140-8496.

Some schematic diagrams may be obtained from
Uniden/Bearcat's parts department, (800)297-1023. Uniden
currently charges a flat rate of $54 for scanner repairs.
They will repair and return "out of warranty" items without
an estimate unless the repair charges exceed the flat rate
charges. The phone number for repair is also (800)297-
1023.

If Uniden doesn't have a schematic, try obtaining a
Photophacts from Howard Sams Publishing division of
Prentice-Hall at (800)428-7267.

G & G Communications (telephone (716)768-8151) is a family
owned company which repairs scanners and stocks parts for
several older models, especially Electra/Bearcat and
Regency brands, but they don't sell manuals or schematics.
They are located at 9247 Glenwood Drive, LeRoy, NY 14482.
(http://www.iinc.com/ggcomm/ or email ggcomm@iinc.com or
ggcomm@aol.com)
...
The Electra/Bearcat BC350, BC300, BC250, BC220, BC20/20,
BC211, BC210, and BC210XL models were hand assembled, and
every one I've serviced had several connections that were
either soldered poorly, or not soldered at all.

==========

There's a LOT more BC-210-specific hints and tips!

To Bote and others:

Thanks for the confidence in "much excellent data", here is some info on the point to point repeater sites (page 149 of the 1996 Police call directory): I monitor the output of the Oxford WGM675 (FX) on what I can describe as a lobe. I am west of the site but anyone within line of site between Raleigh and Oxford will have this clearly with the proper antenna. The input is 42.66, the channel 5 car to base freq. The output is listed in the book. Somewhere east of there, WGM597 in Liberia takes the channel 3 car to base freq. of 42.80 and shoots that to Raleigh, I get that if atmospheric conditions allow. The output is listed in the book. Since many cars throughout the state use 42.66 and 42.80 as their car to base freq., I sometimes hear cars at the extreme ends of the state hit those repeaters.

Now, I am interested in what may not have reached the directory as of yet. A site east of Greensboro repeating 42.78. Dosen't any HP dispatcher or tech monitor this group?
Thanks, WA4KHA

I have used UPS COD frequently and have had to call their 800 number
to track down a check or money order that supposedly had been
"remitted" to me. Recently, I have come to expect a least a 10
working day turn around before you have it in your hands regardless of
cash, check or money order. A call to the UPS 800 number can put you
in contact with the COD accounting department, but don't expect a
quick reply. Once I had received a money order and 5 days later
received a call from UPS telling me I could place a tracer on it.
Dealing with UPS COD is truly an exercise in patience. Just be
prepared to wait. for your money up to 2 weeks.

It's on the 904-916MHz arena and is basically a party line type system.
Theres a way to program into the thing actual "Channels" so others can't
listen in. This may be in the form of a CTCSS tone or DCS but I'd be
willing to bet a scanner could nail it.

Source record: 216939

I have had both at one time or another comments as follows:
The AOR 8000 I just purchased (Used) In general it is not as good as the Yupi 7100.
It is better at SW & MW, but I do not use it for these freq's.
I loaded it up with Mil air freq's and it hit a lot of "Birdies"
I have not yet tried it out on normal VHF UHF like Public Ute's and HAM freq's. So I cannot tell you how well it works there.
It really is not as good as the PRO 43 for that matter.
It does have a LOT of features.

The Yupi was a good solid receiver for scanner freq's (Above SW)

I am looking to set up a new web page for orlando area scanner listeners
it won't be much at first just some links of interest to us in the
Orlando,fl area
no fancy graphics or such just a place to get information
if you live in the orlando area and have some url's that you think would be
pertinant to the subject----E-mail me
thanks

I seem to have no problem finding and monitoring the base station for my local taxi companies, but I'll be ****ed if I can find the mobile (or cab) transmissions. I know they're supposed to be a couple of kilohertz higher, but where? And do they all transmit with such low power that it's a waste of time trying to get the signal at all with a handheld and whip antenna?

I've been scanning for only about a month. I like to listen to local emergency and airplane channels while I shave. Almost sliced my neck this morning when I heard an American Airlines pilot delcare an emergency. I don't have my rooftop antenna connected yet, so I couldn't hear the controller side. A few minutes later, I picked up another pilot asking if the American jet made it down OK. A little later, the local news was carrying the story that the jet (an MD-80) had vacuumed-up some ducks on take-off from Sacramento, lost power in one engine and returned OK.

Wonder how long I'll have to listen to pick up another like this?

Mike

: MHz or to cover the 520 MHz to 750 MHz band?
: ---psiborg@cris.com

No, because the radio was never designed to receive these frequencies to begin with. Below 25Mhz is not really scanner frequencies anyway, you should get a shortwave receiver if you want to pick these up. The other blocked out band has nothing but audio from UHF TV stations anyway, if you really want this you should get a small portable TV and you'll have a picture to boot. Costs less for a TV than to get a scanner which gets these freqs.

Hi Steve,

I just went out and purchased two of them this evening. I'm currently
in the process of testing them and found that the main frequenciy that
they are using is 916.875. For some reason my Scout indicates that
they're on 916.868, but I can't hear them very well when I tune my
ICOM R7000 to that frequency.

I can hear them in Narrow FM mode, but found that they come in much
better if I switched to Wide FM. I don't know how the private feature
works yet, but I will hook up my DC440 to see what they're using.

Well, yesterday 11/20, AND today, 11/21 I received Laser printed "Delivery Notification" letters from UPS telling me the info on the shipment , (info I already had), and the following:

"According to our records, 1 COD parcel was paid for by UPS check number XXXXXX remitted to you on 11/14/96, for the amount of $355.00."

The notice I received yesterday was dated 11/16/96, and the one I received today was dated 11/19/96 and both were sent to me in NJ from Newport NEws, VA....

BUT STILL NO STINKING CHECK!!

No phone call from anyone, EVER as well.......

I do not know if "remitted" means a check was CUT, or put into the mail, nor do I know where it is to be mailed from.

Well, back to the phones today...the folks at the customer service phones are starting to get to know me on a first name basis....<G>

And the saga continues.....stay tuned......

Well, I hope those of you that have been following this tale of whoa are sitting down....

I did something today I should've done at the outset, check with the package recipient to verify how the COD was paid. I ASSUMED it was paid for by CASH, as that is what I specified.

Today, the recipient told me that he paid for the COD with a U.S. Postal Service MONEY ORDER MADE OUT TO ME!

Can you believe it? I thought this was the best way to do a UPS COD transaction?

When I originally began to trace this payment, they told me the package was paid for with CASH. Today they told me it was paid for by CHECK..thats what prompted me to check back with the package recipient.

I am seriously beginning to think something underhanded has occurred here. I'm praying the recipient kept the M.O. receipt.......

Have a feeling this will get worse before it gets better.

If anyone wants to listen to your phone conversations, it's probably
easier to bug your house or tap your phone at the wireline part,
rather than trying to capture and decode digitized Spread Spectrum.

If a person is that worried about being heard, don't use the phone.

Cross-posted to: rec.radio.scanner,alt.radio.scanner

douglas@netcom.com (Doug Mason) wrote:
> Is there any standard freq offset for repeaters ...

In the VHF and Federal Goverment allocations, the offset between the
mobiles and their related bases/repeaters is mostly pot luck. Where the
FCC has allocated bands with fixed offsets, the frequencies (in MHz) are:

Base/Repeater Mobiles Offset

152 157-158 (note) VHF mobile phone / Taxis
160-162 156-157 - 4.6 Maritime VHF
217-218 219-220 + 2 Maritime - AMTS
220-221 221-222 + 1
422-425 427-430 + 5 Detroit, Cleveland, Buffalo
450-455 455-460 + 5
457 467 +10 Maritime on-board UHF
460-465 465-470 + 5
470-509 473-512 + 3 TV chs used in Metro areas
851-896 806-851 -45
935-940 896-901 -39

Notes: VHF phones offsets are: 152.03-.21 +6.46; 152.51-.81 +5.26
Taxi offsets are: 152.27-.45 +5.26
Maritime VHF coastal stations are 160.625-162.025 MHz.
Maritime on-board UHF repeaters are 457.525-.600
In the 'T-band' (TV chs 14-20), bases are in the lower 3 MHz
of each 6 MHz channel.
The 800 MHz Air-Ground telephone usage is reversed - ground
stations are on the lower freqs (849-851 MHz).

For additional details, see the files fcc.allocations and scanner.faf

Who is on it?

I was last driving through Brevard County, Florida in July and
thought I still heard fire department dispatches on 154.415 or
whatever that high band frequency is that escapes my mind right now.

Is the fire department on it?

Like I said
The chp is starting to look like state police force
not the guys that ticket speeders

Cal does have state police they only work on state buildings
They do not ticket speeders

From: bobcat311@msn.com
Message-ID: <00001ff6+00006881@msn.com>
Source record: 217105

The answer is imaging. I have a stranger case of a Bearcat 185 that only goes up to 512 picking up cellphones by way of harmonics and image. To tell for sure if it's imaging, find a freq with phones and another service; if the phones drop out when the other service transmits, you've got an image(the phones are an image, I mean.)

[much excellent information deleted]

Could you describe the use of these high-band frequencies, please?

The listing from which I took the low-band frequencies the other
day also shows these high-band frequencies and comments:
154.92 hand-held extenders (PAC-RT)
154.68 PAC-RT secondary
155.19 base-to-base
155.475 NLEEC [every police department in the universe licenses this one
whether or not it is used]
155.505 repeater, 42.78 mobiles
159.21 mobile control

Perhaps you could elaborate or correct these freqs. and comments.

> ...Also, I
> monitor some of the point to point repeater sites that take the low
> band frequency and shoot it to Raleigh via UHF.

I have heard what sounds like a translator or repeater coming out
on, I think, 42.84, not real strong but I figured they must have
an extensive radio system to cover the whole state. Do they dispatch
most everything out of Raleigh? I would have figured that they
divided it up into regions the way Virginia does.

> The North Carolina
> State Patrol frequencies are the most exciting, most active, most
> professional use of police communications I have ever monitored.

Although I wasn't using the best antenna on my car when I drove through
the state, it seemed that the NCHP freqs. were the least active of
any state between Virginia and Florida. I'll have to borrow a decent
antenna for my next journey. Maybe I'm missing some key freqs.?

Cheers!

Bote

It's probably just a choice of words , the last time I sent something COD via UPS the fine print on the form stated that *CASH* was deemed to be actual money, a certified check or a money order.

No doubt it's *no* consolation to you but any *huge* company that makes millions of transactions a year is going to *screw-up* on occasion. I view peoples complaints about UPS/USPO/FEDEX/ETC. as statistical nonsense because of the *millions* of transactions that occur without incidence.

Jim,
Thanks for the info...and I'll have to check into those AA lithiums.
I order all my AAs through DigiKey in bulk...much nicer at $0.42 a
battery. I'll have to see if they carry any AA lithiums to help bring
down the $4.88/pair cost...ouch!

Strong signals,
Rich Wells

Todd is right. The *best* solution would be to post a large binary to a binaries only news group and then make a pointer post here showing any interested parties where the binary could be found. My news reader shows the size of the articles and I try to avoid downloading any large ones unless they are of particular interest. I still screw up once in a while and have to wait on a long post to download because there is no way to stop it other than exiting the application. I had no intention of encouraging improper binary posts and/or spam. The operative words in my post were: "if you have to...".

The WS-1000 does have this function. But using it is so much more
difficult than the customary per-channel toggle featured on other
scanners, that I hardly use it.

For those that have purchased or otherwise know about the XPLORER, you know that the cell phone ranges of the unit sold to U.S. customers is blocked.
You may also know that an unlock program was to be available at some time.
I received my Geo-db/Xplorer CD/Disk set directly from Percon a few days ago. In the printed instructions, I found an interesting tidbit:

"NOTE: The Geo-db/XPLORER program purchased from Optoelectronics does NOT have the Enable/Disable Full Range function that is included on the version obtained directly from PerCon."

As the cost from OPTO is the same as from Percon, BE FORWARNED if full coverage is a priority of yours.

For those with Scancat Gold, an unlock program is included with the newer editions of the program, or upgradable through Computer Aided Technologies.

Hope the info is useful to you!

The V-Link phones are 900 Mhz walkie-talkies that operate in FM mode.

Each Walkie-Talkie can be programmed to it's own 4 digit number (digits
have a range of 0 - 6)

The Walkie-Talkies can operated in 3 Modes:

1. Public Mode

Out going number is set to all wildcards (number ****)

Both Phones are in Public Mode

Phone number 1 sends a link request as follows:

The Link button is keyed by the operator which causes the
unit to transmit a quick burst of data for a second. The
frequency used is 916.875 Mhz.

Phone number 2 receives that burst of data and sends back
another burst of data to signal phone 1 that someone is
online.

At this point a public link has been established and two parties
can talk to each other like normal walkie-talkies.

2. Party Line Mode

Out going number contains some wildcard (number 123*)

Both Phone are in Public Mode

Phone number 1 has it's number set to 1234

Phone number 2 has it's number set to 1235

Phone number 1 sends a link request as follows:

The Link button is keyed by the operator which causes the
unit to transmit a quick burst of data for a second. The
frequency used is 916.875 Mhz.

Phone number 2 receives that burst of data and sends back
another burst of data to signal phone 1 that someone is
online.

At this point a public link has been established and two parties
can talk to each other like normal walkie-talkies.

Note: only phones with a number of 1230 - 1236 will answer the
initial request. All of this still occurs on 916.875 Mhz.
There doesn't appear to be away of establishing 2 seperate
party lines at the same time without causing interference.
I think they may be using DCS to accomplish this.

3. Private Mode

Phone 1 Out going number contains no wildcards (number 1235)

Phone 2 Out going number contains no wildcards (number 1234)

Both Phones are in Private Mode

Phone number 1 has it's number set to 1234

Phone number 2 has it's number set to 1235

Phone number 1 sends a link request as follows:

The Link button is keyed by the operator which causes the
unit to transmit a quick burst of data for a second. The
frequency used is 916.875 Mhz.

Phone number 2 receives that burst of data and sends back
another burst of data to signal phone 1 that Phone 2 is
online.

At this point both phones switch to another frequency in
the 902-916 range. Most of the private conversation that
I established were in the 912 - 914 range.

I've had an 890XLT for more than a year now. I like it just fine. Of course I was upgrading from a BC210 so maybe the step-up just left me dazzled. I'm a novice scanner person so can speak with any technical savvy at all. But from the novice point of view, the 890XLT does everything I need and then some.

Anyone hear about that Rubber Duckie Scanner Preamp "gadget" that they now sell at Radio Shack? Apparently, it will boost weak signals and is a little "amplifier" that fits between the handheld and the rubber antenna (although I suppose it will work with base models also). I am no engineer, but, I thought if you have a weak signal and then boost it, you will simply have an amplified weak signal - as opposed to a strong clear signal. For example, cable TV. The amps work if you had a strong signal on 1 set but hooked up 4 sets and the signal got weak. At least you were boosting a strong signal. Here, in our case, will this gadget work if the signal is weak to begin with? Anyone try it yet?

Usenet will cancel any binaries larger than 50 KBs that are posted here
since this is *not* a binaries only news group. If you have to post a
large one, it's better to break it up into several posts of <50 KBs so
the Cancelbots don't remove it before everyone can read it.

I am amused!

Well, OK, I'm really not amused...

Given that AEA is in the process of selling off their residual production to go out of business, I am just amazed at this impressive good deal R&L Electronics is offering... NOT!!

It sure looks to me that they're all too willing to screw a few customers to solve their stock problems...

Wouldn't it have been a little more fair of you to caveat your ad here with the note that they who buy AEA products now do so with little to no possibility of product support, since AEA is about to go belly up? Oh well, bidness is bidness!!!

As always: caveat emptor. I'll remember this ad next time I'm shopping for gear...

Hello All,

I just completed a transaction using UPS COD. It took 5 business days
to send a Y-FT-470 HT from FL to Calif. I indicated only Cash or
M.O. I liked that I was able to track the package over the I-Net on
the UPS Home Page for free. The U.S. Postal Service will allow
personal check from anyone. The Postal Clerk told me "it makes it
easier on us"-Not Acceptable. My main concern now is how long it will
take me to get my funds from UPS? I'll make a post when I get the
loot.

73,
Paul, KF4LNN

Well correct me if I'm wrong but you are still alive and UPS is still
in business and I strongly *suspect* it will get cleared up, though
you may have a bit of red tape to sort through. And yes I would be
upset too if it was my $355.00 but I still say I regard most flame
messages about mass products/services to be statistical nonsense, take
your $355.00 (and all the other dollar amounts from recently posted
flames of UPS)and divide UPS's current yearly revenue of 21 BILLION
dollars into it, and tell me what the percentage is ????

Those were used for truck enforcement, there was no plan or consideration to going to any color for regular patrol units besides black and white. CA state law dictates that in order for a police vehicle to be used in traffic enforcement, they must have a logo on a white door (Still don't understand how Visalia gets away with all-blue cars though)

I have seen an interesting departure from the standard black and whote scheme on a Santa Barbara based Mustang. The front windshield frame and the first 3/4 foot of the roof was painted black, so when looking at the car from head on, it looks like an all black Mustang.

> -> The pick ups are for code/truck ins.
> -> In the snow areas pick ups and Suburbans

I've never seen a pick-up used as a patrol unit outside the truck enforcement duties. I've seen Ford Broncos, Jeep Cherokees, Dodge Ram Chargers, and the aforementioned Suburbans.

> -> They also have some Suburbans for special ops.
> -> The CHP has been doing more then code/highway/speed work as of late

Isn't that thier job?

> -> They are starting to look like calif state police dept
>

Question. Are the officers assigned to the protection of state buildings still wearing the State Police uniforms, or CHP uniforms? They had a cool

patch and actually decent looking graphics on thier cars.

>

I've seen the LAPD with motorcycle mounted shotguns, but haven't seen any
CHP motors with 12 gauges.

> The majority of units in remote areas (rural) all carry assault rifles.
> All the supervisor's units (Sgt's) carry the weapons in urban areas.
> More indivdual units are getting them in the urban areas though.

I think with the recent shooting death of a CHP officer in Fullerton and
the shooting of a CHP officer in Bakersfield a couple years back, there
is going to be some serious consideration of increased firepower for CHP
officers.

Hey Folks

In Hockey, when a visiting team visits the oppositions home for a game, the assistant coach of the visiting team (the guy behind the bench) usually wears a headset to commnuicate with the other assistant coach who is in the press box watching the game from up above.

Does anybody know which freqs. those headsets might be located?

Thanks

Gus

> if I can find the mobile (or cab) transmissions.

Taxi companies operating bases in the 152.270 - 152.450 allocation would
have mobiles 5.26 MHz higher (or occasionally half-duplex on the base freq).
In the 452.050 - 452.500 allocation, mobiles are 5 MHz higher.
Taxi seldom use repeaters, to keep drivers from chatting with each other
and to prevent arguments about calls (if you don't know where another driver
is, you can't complain that you're closer to the fare). With a ducky, you're
unlikely to pick up the mobile more than a mile or two away.

I was very disappointed in the BC890XLT (and its PRO-2036 twin)
I tested for Monitoring Times. The new PRO-2045 replacement
is much better (but overpriced at $350 list price).

From the FAQ:

BC890XLT (Uniden): Same as Radio Shack PRO-2036. Tuning
knob. 200 channels, global delay. Count, AUX, and Auto
Store features. Scans and searches fast. Accepts optional
CTCSS board. Dual conversion with 10.8 MHz and 450 kHz IF
-- lots of images and birdies. Prone to severe intermod,
especially when used with an outdoor antenna. See "The
Uniden BC-890XLT and Radio Shack PRO-2036," by Bob Parnass,
in June 1995 Monitoring Times.

Well, now you're just showing all the wannebe posters how to CIRCUMVENT an idea meant to KEEP posters from posting large binaries from newsgroups.

Breaking it up, you're STILL taxing the phone bills of many a user, any way you look at it, when you do that.

And they won't appreciate that too much.

Todd

<Sigh!>

If I may make a suggestion...

If you all want to post binary files that BADLY for other people to see, then why doesn't the group get together and put up a CFV [Call For Votes] (that's `yea' or `nay') on whether or not to create a new newsgroup - a companion one to this - called "rec.radio.scanner.binaries." The purpose of this newsgroup would be for the dissemination of scanner/scanning-related binaries (aka "files", such as GIFs, JPEGs, large frequency database files, etc., which otherwise would be meant for the reception of a specific few, or for those who really WANT the files. This way, those who want it can subscribe to the newsgroup VOLUNTARILY, and files unwanted by some are still not forced to download them.

(Bet you didn't know you could do that, eh? If there is a moderator, is he listening?)

This is the second time that I have suggested this, but a few in the group seem to be ignoring it and continue to push for actual CIRCUMVENTION of the safeguards designed to protect the other newsgroup readers from large binary postings.

Those of you who want it, please, start a CFV for your own special newsgroup, and once created, you may subscribe to it if that is what you wish. But meanwhile, you have to take into consideration the phone bills of others who may not be interested in your special files.

Not a flame, but it seems like it needs to be dealt with.

Thanks,

Todd

You probably DID find them; you just didn't realize it.

Many taxi companies now use a packet-like system to make `bids' for a new call. First one to hit the send button (and/or, too, the closest one to the call) gets the call.
My brother used to work for Gator City Taxi and Yellow Cab in Jacksonville, Fla., and they use that system.

I don't know what it is actually called.

The other problem might be...

Taxis drivers often tend to drive WAY out of thier "legal" territory in desparation to grab that better-paying call. And to encourage this (though I'm sure they don't look at it this way) the base stations can often be heard far out of thier territory, while the mobiles can barely communicate with the base in thier own territory.

For example, I hear Jax all the time here in Gainesville, ALL TOO CLEARLY, 80 miles away. But I know the cabs can't communicate back. Just too far, until they come back into range again.

(Alright cabbies, don't even think about defending that. I know how it goes. I see it at the airports every time. :) There's always one cabbie screaming at another about territory and vehicle badges. ;-))

Can someone tell me the capabiliites of a mod'ed Pro-26?

Specifically,

What Cellular ranges could it recieve? and with which mods?

Also,

If anyone is looking to sell a Pro-26 Please let me know...

Thanks

It's great for low freq....

It's very very good picking up 155's and 156's and 157's I get way up into the Wine Country from the Bay Area..and I'm up against the Hills.....

Have no problems with 800's either...but wobbly at time.

As for the 460's up to the 490's....nuttin. It just passes them by....on any antennae usedd.

Seeing as how i have a need for low freq and the 155's it suffices....but the BC and Radio Schack (bc 790 and rs pro 2026) outperform it on all channels in all reaches.....

The BearCat 300 and this one for the low and 155's very similar.....

I picked one up from RS for $125 last month. What a great deal.. It does a very good job for my semi-rural area in Northern San Diego County. I also could swear that I keep getting these unwanted weird phone calls on the radio at about 894 and 895 mHz. Funny I could say they are cellular but at the wrong freq. They sure come in like gang-busters..

What is so wrong with posting to an appropriate binaries newsgroup, like alt.binaries.misc; then posting a message here pointing folks to it? This is the way most other discussion newsgroups have handled it.

Personally I think we should keep the binaries out of the scanner discussion newsgroups -- there IS a reason there are alt.binaries newsgroups out there.

There are ISPs who will drop discussion newsgroups for excessive binary content; and some folks have to download every byte of every message.

Personally I think we should just post them in a binaries newsgroup, then post a message pointing us over there; binaries in this newsgroup are so rare I don't think it justifies a separate newsgroup for that.

Just my $.02. :)

You should probably take your own advice.

In general, no - people cannot see how many answers have
already been posted right away. It takes a couple of days
for articles to propagate to all servers.

I have read numerous posts on how lockouts cannot be used with this scanner.
I have the Standard C508A which is the Amateur Radio dual-band handheld transceiver with 800 mhz receive. The "lockout" method of this unit is rather a form of "select scan" where you choose what frequencies TO scan rather that NOT TO scan. Documentation of this in the owner's manual is poor, however.
For those with the unit, see if you have a function called "mm". If so, I'll describe the scan feature of the C508A, which may apply to the WELZ unit (both made by Standard in Japan).
I am interested in purchasing a unit.

I've been looking around the net for a nice cell-capable scanner for a while for around the $200 range, but had no luck. So then I decided to see whats out there "new". I found the 220XLT-z (what does the z mean???) on this Monitoring Times magazine add going for around $200, what do people think about this scanner? How easy is it to modify?

Any feedback will be appreciated! Thanks!

Hi Rich,

> Eurpean version of the 26 which Javiation sells for full 800MHz
> (although other regions will be blocked as per European restrictions).

The PRO-26 (20-9506) has 25-1300MHz continuous - there are no "gaps". The PRO-26 is only available in two flavours - with full coverage or the one for the US market (20-506).

There are no restrictions and never have been on the frequency coverage of scanners in the UK.

With and with the free movement of goods within EC member countries it could be said the same applies throughout EC Europe although in some member countries the legallity of scanners does still seem a little "grey".

I think Germany was the only country that did allow scanners but with restrictions in coverage. Until recently (a couple of years back now) scanners were only allowed with the Amateur bands on but they no longer have this restriction. In Denmark also the scanner is no longer illegal with no restrictions on coverage.

Hope that helps

4731. Pro62 vs Pro51

Newsgroup: rec.radio.scanner
Date: 1996-11-23 00:00:00 UTC
From: chris@gem.kern.com
Message-ID: <5778u6$bcn@ns.kern.com>
Source record: 216811

Anyone have any opinions on these two scanners? I just purchased the 62 less than 30 days ago on sale for $199 ($100 off) and the 51 is now on sale for a little more than $100 off. Should I return my 62 for the 51?

I like the case and display better on the 51 as it is a tad bit larger. The 62 has a TRIPLE CONVERSION SYSTEM as the 51 only Double but the 51 scans @ 50cps and the 62 @ only 25cps.

Here's the matrix:

Pro-62	Pro-51
Conversion Sys.	Triple Double
One Touch Weather	No Yes
Service Search	No Yes
CPS Scan Rate	25 50
CPS Search Rate	50 100
Freq's	30-54 29-54
118-174	108-174
380-512	406-512
806-823.9875	806-823.9375
849.0125-868.9875	851-868.9375
894.0125-960MHz	896.1125-956MHz

Such a slight difference in frequencies. I dont even understand why there are two models that are in such close range...

Any insight/info would be greatly appreciated.

BTW, I'm mostly using the scanner for mobile in the car use w/ the built in antenna on the scanner for CHP, Sheriff, etc. Seems that most CHP's in California have really weak radios. I can be less than 1 mile away from a CHP mobile and barely here him.

Anyways, TIA.

chris

4736. SACNNER ACTION BUSTS UNDERCOVER STING!!!!!!

Newsgroup: rec.radio.scanner
Date: 1996-11-23 00:00:00 UTC
From: atocco8586@aol.com
Message-ID: <19961123213900.QAA02542@ladder01.news.aol.com>
Source record: 216816

CLEARWATER FL. COPS WERE RUNNING AN UNDERCOVER PROSTITUTION STING WHERE A FEMALE COP WAS ACTING LIKE A HOOKER. ALL CONVERSATION THAT TRANSPIRED BETWEEN THE UNSUSPECTING JOHN, AND THE UNGERCOVER COP WAS BEING TRANSMITTED TO A FORD BRONCO. THE DRIVER OF THE BRONCO(ACOP), UPON HEARING CONVERSATION SUFFICIENT TO MAKE A SOLICITATION ARREST, WOULD DISPATCH A UNIFORM OFFICER IN A MARKED CAR TO PULL OVER THE JOHN AND ARREST, OR TICKET HIM.

A SCANNER LISTENER PULLED HIS CAR ABOUT 30 YARDS FROM WHERE THE HOOKER-COP WAS "WORKING". THE UNDERCOVER COP APPROACHED THE LISTENER AND SAID EVERYTHING SHE COULD TO TRY TO GET THE SCANNER LISTENER TO OFFER A SPECIFIC CASH AMOUNT FOR SOME SEXUAL ACT. IT WAS UNBELIEVABLE THE EXTENT SHE WENT TO TO TRY TO ENTRAP THIS SCANNER LISTENER. THE SCANNER LISTENER FINIALLY LET THE COP KNOW THAT HE KNEW WHAT SHE WAS DOING, AND THAT HE COULD HEAR WHAT WAS GOING ON OVER THE SCANNER. THE UNDERCOVER COP THEN WALKED AWAY, AND THE SCANNER LISTENER DROVE AWAY. NEEDLESS TO SAY, THE SCANNER LISTENER WAS PULLED OVER BY A MARKED CAR AND QUESTIONED ABOUT WHAT HE WAS DOING TALKING TO THAT GIRL, AND WHAT HE WAS DOING WITH THE SCANNER. THE SCANNER LISTENER REPLIED THAT THE GIRL WAS DOING MOST OF THE TALKING, AND THAT THE SCANNER WAS NOT ILLEGAL, THEREFORE IT WAS NONE OF THE OFFICERS CONCERN WHAT HE WAS DOING WITH THE SCANNER.

THIS PERSON PLANS TO ATTEND MORE UNDERCOVER ENTRAPMENT OPERATIONS, AND ATTEMPT TO KEEP THE COPS WITHIN CERTAIN LIMITS.

I AM VERY INTERESTED IN WHAT ALL YOU SCANNER JUNKIES HAVE TO SAY ABOUT THIS, SO PLEASE RESPOND WITH ANY COMMENTS OR OPINIONS.

4737. PRO-29 MOD, some say it's possible

Newsgroup: rec.radio.scanner
Date: 1996-11-23 00:00:00 UTC
From: Brian Hall <bhall@cougarnet.byu.edu>
Message-ID: <32976A16.5BAC@cougarnet.byu.edu>
Source record: 216817

I've been told that it's impossible for the PRO-29 to be modified to receive cell, however, in the Sept./Oct. issue of National Scanning, there's an ad for a company that charges only $40 to unblock the full 800 MHz range and they do it for the PRO-29 as well as a bunch of other scanners.

I'm confused. Is it, or isn't it possible to unblock cell on the PRO-29. If it is, I want to do it myself, and not pay the $40 to have it done.

If anyone knows how to unblock cell for the PRO-29, I'd sure like to hear about it.

4738. For Trade: Mint BC-200 W/cell mod

Newsgroup: rec.radio.scanner

Have a mint BC-200 (cell mod done) with leather case, charger, antenna, manual, original sales slip & box w/packing. I would like to trade for a likewise mint radio shack Pro-43 handheld scanner. The Pro-43 should be date code 2A4 or earlier (cell mod done or not as long as the date code is appropriate) May consider an alternate scanner, but really interested in a Pro-43 as described herein. If interested, please e-mail me at radioman@localnet.com
Regards,
Ray Miller N2NJK

4739. ??: AR2700 Control via PC Interface (Commands):

Newsgroup: rec.radio.scanner

From: dmitton@mulberry.com
Message-ID: <575hj2apb1@gollum.kingston.net>
Source record: 216957

I've been working on some programs to control the AOR AR2700 from the PC port. Initially I'm concentrating on upload and download of the memory bank information, then some control of the VFO.

I've come up with a couple of questions I hope someone can help with.

1) What is the process to store information into the SRCH memory???
When you query it is in the format:
SR1 SL0869040000 SU0893970000 AU0 MD1 ST030000 AT0

It doesn't take when I write that back!! (After changing it to something else!!!)The SCAN bank MX command works perfectly!

2) What is to be used for the UP/DOWN arrows in a dumb terminal program??? The actual ASCII or HEX data would be helpful.

This is interesting stuff ... my interests in C programming and scanning meet!!! :-)

Thanks in advance for any information.

I can give ya alot more of the particular assigned areas and channels... You are correct, they are, as a general rule, most professioal and interesting to listen to. I have very little access to them at home, but my pick-up is equiped with a Motorola low-band mobile and it can hear dispatch up to 100 miles away but cars only around 10-20 miles.

Hi all!

Mil air is my specialty!

Here is my list.

275.800 Snowbirds CH. 1
295.600 Snowbirds CH. 2
310.800 Snowbirds CH. 3
227.600 Snowbirds CH. 4
243.400 Snowbirds CH. 5
240.500 Snowbirds CH. 6
378.500 Snowbirds CH. 7
266.300 Snowbirds CH. 8
294.500 Snowbirds CH. 9
322.800 Snowbirds CH. 10
245.700 Snowbirds CH. 11
316.500 Snowbirds CH. 12
344.500 Snowbirds CH. 13
356.600 Snowbirds CH. 14
236.600 Snowbirds CH. 15
283.900 Snowbirds CH. 16
363.800 Snowbirds CH. 17
289.400 Snowbirds CH. 18
245.000 Snowbirds CH. 19
239.800 Snowbirds CH. 20

However, 245.750 (not on list) seems to be used nearly always as of late (last 3 or 4 years here in Canada). It seem to be their standard freq. The others are for alternates if their main freq is in use at the location of the show.

I am part of a crew that makes professional videos for airshows. My job as a ham and scanner nut is to provide communications audio interception for one of the audio tracks on the video. It is a blast. You get in for free and get to be at show center and attend all the pilot brfngs etc. Need a freq, just be at the show briefing! Even got a copy F16 gun camera footage of a participating pilot's show routine in my video library!

Just scanning and hoping for a hit is useless! The comms are so short your scanner will almost (read not) never stop, even if you have the right freq. You must have your scanner stopped and specifically monitoring that freq.

Have seen a lot of people post that the only difference between the two radios is the 800 MHZ board is
missing from the 100xlt. Yes, you can convert to 800 however there are several differences. You would need to insert the new rf board, make the modifications to the process board, A N D install the
800 mhz capable VCO board. Taking all this into consideration, it is not usually worth the effort... and
expense!

The HX1500 does not have the same reset as does the HX1000. More than likely, it's been my experience
that reverse polarity immediately knocks out several voltage regulators in the HX1500. Reverse polarity in
the HX1000 use to be a catastrophe as there were no regulators and voltage was reversed directly to
several major components.

If the damage stopped at the regulator level, you may just need to replace them.

> RobertNote from the author: I'm sorry I didn't publish this information =
sooner.
I've known of the extended capabilities of this radio for a couple of years=
=2E
I made a few attempts to make deals with various radio mod shops. Most fel=
t
the time needed to make key pad entries was too long to make a profit. I h=
ope
you'll enjoy the added coverage of the radio, and forgive my belated releas=
e
of this information.

If you have questions, I will try to answer them via e-mail.

Please, feel free to share this information with others that own one of the=
se
fine radios. I would appriciate it if you included my call sign with all
copies of this information.

-Al n8kli@aol.com

PRO-43 Shortwave & Extended Receive
Al Mellon N8KLI

(This modification is only possible on radios able to be modified to receiv=
e
the full 800 MHz range.)

Scope and nature of the modification: To allow the PRO-43 to receive
frequencies from 6 MHz to 1000 MHz. This is accomplished by setting the PR=
O-
43 to non-standard splinter frequencies, the CPU will then step the radio
beyond the normal band edges. To derive the non-standard splinter frequenc=
ies
it is necessary to change the diode configuration matrix, and to use the
monitor-search function. The hardware modification should take about thirt=
y
minutes. The remaining programming / search will take as little as 45 minu=
tes
(depending on how interested you are in the signals you encounter during th=
e
806 MHz to 30 MHz search to be run).

I claim no responsibility for any damage done to your radio by attempting t=
his
modification. I will also not be responsible if you use this radio to brea=
k
the law by monitoring cellular mobile telephone transmissions.

Anyone attempting this modification should be comfortable working with surf=
ace
mounted components and have a reasonable familiarity to the key pad functio=
ns
of the radio.

STEP 1 (DRAWING 1)

- Remove the antenna

- Remove the battery pack

- Remove the four screws (A)

- Remove the rear cover

STEP 2 (DRAWING 2)

- Remove the six screws (A)

- Using a knife blade, pry the connector at the bottom of the circuit board=

apart (B)

- With the connector (B) apart the top circuit board can be pressed side to=

side to allow removal of the two hidden screws (C)

- Lift the two stacked circuit boards (watch the connectors on the right ed=
ge
of the main board)

- Swing the two stacked boards to the left (as shown by the arrows)

STEP 3 (DRAWING 3)

- Remove the RF shield by heating the four solder pads (A) and GENTLY pryin=
g
the shield up at the corners. Watch for any surface mount components!

STEP 4

- Note the location of diodes D1 - D5 (factory U.S. configurations has dio=
des
D1, D2, D4 in place).
See DRAWING 4

Diodes D1 - D5 enable the following functions
D1 - KEY LOCK switch enable
D2 - 30 MHz to 54 MHz enable
D3 - 54 MHz to 88 MHz enable
D4 - Cellular lockout enable
D5 - Cellular 12.5 KHz step enable

The normal broad band coverage modification (DRAWING 5A) has D1, D2, D3 i=
n
place providing the following coverage:

30 MHz to 88 MHz
118 MHz to 174 MHz
220 MHZ to 512 MHz
806 MHz to 999.9875 MHz
(30 KHz cellular channel spacing)

If your radio does not have D3 then move D4 to position D3

D5 should not be in place

See DRAWING 5B. Solder a diode - cathode side (has the line) to the uppe=
r
side of the D5 position. Make sure that the leads are the proper length =
to
allow this new diode to sit on top of D2 and D3, and that none of the leg=
s
touch. Solder the anode side to the lower side of the D1 position.

Installation of this diode allows the user to select the channel spacing =
in
the cellular bands. KEY LOCK off at time of power on yields 30 KHz spaci=
ng.
KEY LOCK on at the time of power on yields 12.5 KHz spacing. By using th=
e
monitor memory and changing this configuration in the middle of a search =
in
the cellular band we are able to derive non-standard splinter frequencies=
=2E
This seems to evade the CPU programming of the allowable band edges,
allowing the radio to search beyond normal frequency coverages. At 30.00=
5
MHz, the next downward frequency (at 5 KHz steps) is 30.000 MHz. The CPU=

then realizes it has reached the lowest valid frequency, so that the next=

step down the operating frequency is set to 999.9875 MHz. We will store =
a
frequency of 30.0025 MHz in channel 200. Using the DIRECT feature of the=

radio we are able to tune to a frequency above or below any stored
frequency. The CPU reads 30.0025 steps down by 5 KHz and is now at 29.99=
75.
Since the frequency still does not equal 30.000 MHz it is able to step do=
wn
again. 29.9925 MHz - you probably get the idea. At 2.5 KHz it does jump=
up
to 999.9975 MHz and then to 895.9875 MHz. (Sensitivity drops below 15 MH=
z,
but remains useable to about 6 MHz.) In the procedure below you will stor=
e
band edge frequencies that can be stepped above or below to grant added
coverage. The CPU will not store in memory any frequency outside of the

permitted coverage. This necessitates the use of the direct mode.

STEP 5

- Reassemble the radio

STEP 6 Keyboard entries

- With the KEY LOCK switch OFF turn the radio on. The unit will now step b=
y
30 KHz steps from 825 MHz to 845 (cellular mobile input channels - base
channels are 870 MHz to 890 MHz)

- Set the squelch to open (MIN) and volume to low

- Enter to the key pad

PGM LIMIT 30 ENTER LIMIT 825.120 ENTER

DOWN LIMIT DOWN MON

(The display should read 825.120 down search)

- Turn the KEY LOCK switch ON and turn the radio off

- Turn the radio on and set the KEY LOCK switch to OFF

- Enter to the key pad (Squelch should still be open.)

MANUAL MON DIRECT DOWN

(The display should read 825.1075 down search)

- Close the squelch to allow the radio to search down.

- Use the UP DOWN and the squelch control to stop the radio at 806.0075 =

radio at 26.6125 MHz

- Enter to the key pad

UP (The display will now read 26.6175)
MON The radio is now locked to the correct frequency
(the AFC will lock the radio to 26.620 MHz)

STEP 7

- Ask yourself why Radio Shack did not include shortwave or extended VHF
coverage in the PRO-43 software.

Answer: They wanted to sell you a shortwave receiver too.
- OR -
They've just grown accustomed to following the leaders, not bein=
g
one.

Notes:

*****> It is necessary to drop below the desired HF band frequency and then=

search up to re-enable the VHF-LO band circuitry. None of the other bands
require this. <*****

The lowest frequency I've been able to copy with out modification of the RF=

cicuitry is 5.8 MHz.

The best SWL sensitivity is from 15 MHz and up. I use my 2 meter 5/8 wave =
HT
antenna for SWL and have good results from my office. As with all rigs, an=

outdoor antenna works far better than an undersized rubber duck.

When listening to 10 meter FM check your mode.

If the key pad operations must be interupted, it is not neccesary to restar=
t
the programing from 825.120 MHz. Simply go to the last memory channel
programed with a non-standard splinter channel in the manual channel mode.
Then enter to the key pad

DIRECT DOWN

This will restart the search from the last possible frequency.

Steps to enhance the HF receive sensitivity.

- Remove L101

I keep on hearing things about how bad the ar8000 ducky antenna is. I bought mine about 2 weeks ago in Australia and mine appears to be working properly. I havent had a really close test with another scanner Ive got but it appears ok. Its certainly better than the one that came with the ar1000!

Maybe us Australians are the lucky ones!

Cheers

Matthew

Really hate to ruin your day wayne, but channels 11, 12, and 13 are
wrong. They just changed them this year for reasons unknown beleive me
or not, and i can't give you the new ones. Well good luck in finding
the new freqs, cheers.
P.S. the reason i know this is because i work on the aircraft at their
home base.
Again good luck in finding the freqs and happy scanning.

>Also is there any keypad tricks or other mods for this unit?

My P-39 was purchased about 3 years ago with the same freq specs. In Chicago area, 851-869 brings in a substantial amount of cell-phone traffic, (images?). Modificatin to get 869-896 involves removing 2 or three layers of PC boards and clipping diode D-6 under the silver RF shield. Anyone with reasonable skill in small circuit soldering can probably do it without destroying the unit. (But don't do it because you would have to turn yourself in to the FCC for gross illegal activities).

In article <32976CC6.440F@cougarnet.byu.edu>,
Brian Hall <bhall@cougarnet.byu.edu> asked:

> What's a birdie?

A "birdie" is a signal which is internally generated within
the receiver itself.

Modern radio receivers contain one or more oscillators which
generate signals not only on their fundamental frequencies,
but on harmonics, too (N times the frequency, where N=2, 3, 4, ...).
The radio "hears itself" if tuned to one of these products.

For example, I heard harmonics of the 12.8 MHz oscillator
in an AOR AR5000 receiver I tested. Each birdie appeared
as an unmodulated ("dead") carrier.

In multiple conversion receivers, the signals (fundamentals and/or
harmonics) from two or more oscillators can mix together and
produce birdies at several frequencies.

Most of today's scanners use one or more internal microprocessors.
The clock signals can generate birdies, too.

From the FAQ "Introduction to Scanning:"

..... The Electronic
Communications Privacy Act of 1986 made it illegal to
listen to mobile phones, common carrier paging, and a few
other types of communication. Public law 103-414, signed
Oct. 25, 1994, amended the law (Title 18 USC, Part I,
chapter 119, sections 25110 and 2511) and outlaws listening
to cordless phones, too,....

This note applies to the USA.

1) Was this "scanner listener":

a) a federally licensed amateur radio operator? or,
b) a licensed alarm system contractor? or,
c) a member of the Press on active duty? or,
d) a civilian member of a Crime Watch unit with a scanner in the
vehicle wherin written permission to have a scanner in the vehicle
was granted by either the Chief of the local police or Deputy
Sheriff? or,
e) even in an emergency vehicle on official duty? (This doesn't sound
like he was.)

If not, your "scanner listener" was operating illegally, because, in the
state of Florida, Chapter 843, Section 843.16 of Fla. Statutes defines that
persons operating scanners in motor vehicles, which the above "scanner
listener" was obviously doing, is prohibited unless you are included in one
of the above exclusions. It is a misdemeanor of the second degree, here.

> THIS PERSON PLANS TO ATTEND MORE UNDERCOVER ENTRAPMENT OPERATIONS,
> AND ATTEMPT TO KEEP THE COPS WITHIN CERTAIN LIMITS.

And 2) chances are that this "scanner buff" will be the next victim of a
sting specifically designed for HIM if he appears in the vicinity of another
official police operation and his actions cause the slightest bit of
interference or "spooks the prey", so to speak, and it is then witnessed by
any of the officers involved.

What he was doing borderlines on "vigilanteism." (sp? Also, is that
even the right word to use?) Here, he's trying to police the police, a
dangerous thing for any citizen to try when the law is not in his favor

to begin with amidst such power. He could easily have been charged with obstruction of justice. Interestingly, that is the main reason behind the Statute. Your "scanner listener" would not want "obstruction of justice" under his belt, too.

What he is doing is called "taking the law into your own hands." If he suspects the police are using unorthodox and unconstitutional measures in thier efforts to curtail prostitution, then your friend could maybe consult the local Press and get them to set up thier own undercover monitoring to bust it in the open, and leave it to the Press to get in the trouble then. But nothing works better than a TV News video camera and the video splashed all around on the TV news. (And you just had some riots down there, so the Press might be especially interested right now in unorthodox police actions that can be proven.)

Also, a call to the IAD of that police department would also suffice, and perhaps the local newspaper to boot.

Those are safer bets for that "scanner listener."

I know it stinks to hear cops doing things like that to people but, there's no reason to put yourself (so to speak) in harms way when other methods would work just as well with less risk.

Too, THE ABOVE IS JUST MY OPINION.

For the actual written law, see:

http://www.afn.org/~afn09444/scanner/scanlaws.html

...and click on the Florida scanner law.

And *another* thing that hit me after I sent the above reply was:

...that the above "scanner listener" was also "LOITERING" if there for no
other reason. [His car broke down there, right? <wink-wink> :)]

So, the score would be:

1) Illegal possession of a scanner;
2) Obstruction of justice (if he was found to be interfering);
3) Loitering;
4) Resisting arrest (if the "listener" got bold and spoke up in his
defense, even if calm-voiced and nice about it; they often don't
want to hear it when they get angry);
5) (Whatever else the officers might wish to come up with on him).

4770. [HELP] Uniden BCT 7 vs. BCT 10

Newsgroup: rec.radio.scanner
Date: 1996-11-24 00:00:00 UTC
From: scotte@shore.net
Message-ID: <578rgs$g88@northshore.shore.net>
Source record: 216766

I am in the Boston area and am considering getting the BCT 7 scanner.
On-the-fly scanning for my area is very nice to have.

The question I have is should a service decide to change frequencies, how
flexible is Uniden in upgrading the ROM with the changes, or am I stuck
with programming the new frequencies into the 100 scratch memories?

I'd also consider the 10, with its considerably smaller size, but the 7
gives me scratch space and isn't limited to just police.

Also, I think the price is right for either.

Any comments on either/both models?

Try here on Dean Hoisak's webpage...

Article 1101 of ncf.sigs.radio-scanner:
Sender: am975@freenet6.carleton.ca (Dean Hoisak)

I've setup a web page with lots of frequencies for Eastern Ontario &
Western Quebec. The pages are optimized for use with Netscape 2.0 as
there are frames & java scripts running. The pages are located at the
following URL:

http://www.achilles.net/~dhoisak/freq/eofl.html

The pages usually get updated 2-3 times a month so its best to bookmark
the web site for further return visits.

Has anyone successfully used an HP200lx palmtop to program their AR8000? If so, what software program have you used and which connector from the HP Connectivity pack have you used. I have the CAT232C serial interface and have successfully programmed the AR8K with my desktop, but I cannot seem to get the palmtop and the 8K to communicate with each other. One possibility is that the HP200lx does not supply enough power to the CAT232C. I am open to suggestions, thories, etc.

Being that the unit is an ICOM, I would start off by using a program
that controls the R7100 or R7000. Scancat Gold would be my first start.
I'm taking a guess that Icom didn't reinvent the wheel and redo thier
computer control command set.

I have used Scancat Gold, Scanstar, Scannerwear, PC-Manager, Radio Manager, and Probe with the CX12AR. Basically the CX12AR converts the data signal out of your scanner to a level that is compatible to your computer's serial port.

I have a Radio Shack PRO-2004 which works great. I need an operators manual, schematic and service manual if they are available.

Has anyone ever come up with a signal strength indicator which will work on thios model?

We Shall Never Surrender

On November 21, a year to the day after the end of the Bosnian war, and the day after the Croatian Telecommunications Council tried to shut down Radio 101, while Croatian president was still recovering from a cancer treatment in an American military hospital, American Condor unloaded 45 tanks, 80 armored personnel carriers, 15 utility helicopters, 45000 rifles, ammo, 5000 pieces of communications gear in Croatian port Ploce. This shipment would go as scheduled, since Muslim defense minister of Bosnia (whom Washington accused of ties to Iran) was removed two days earlier. And Croatian president would continue to receive VIP treatment in the U.S. even if Croatian government did not back-pedal on its decision to revoke Radio 101's broadcasting license, bowing to the pressure of its own citizenry. Croatia, after all, is an ally.

Bolje Rat Nego Pakt (War is better than agreement - an old partisan saying)

Received weapons made Bosnian three presidents purr and obediently sign the agreement in Paris adopting a peace plan. Which peace plan? Don't ask me. One of many. With all those weapons it sure wouldn't last long past the departure of IFOR from Bosnia. But it is adopted. That makes Clinton shine again (after not so much domestically cheered decision to extend stay of American forces in Bosnia).

Bolje Grob Nego Rob (It is better to die than to be a slave - another old partisan saying)

My friends sent me a note from Zagreb saying that the Museum Mimara (the largest Croatian art museum) had sent its letter of support to Radio 101, too. Museum had put a p.s. note at the end of the letter: "We even forgive you that you stole our vase." Wow, this was long due. Yet, rare a listener understood the reference, and just a handful of producers got the joke from the early glorious days of 101. Zrinka Vrabec certainly got it. After all, she was the one who anchored the show about the stolen vase in May 1985. Actually, she anchored it together with Hloverka Novak, who is today the editor-in-chief of state controlled Croatian Television (HTV). Sadly, in those recent days Hloverka was not heard voicing her support to the radio station that made her, nor comforting her former colleague (Zrinka) who is now editor-in-chief of Radio 101 and whose mother works for Hloverka as a producer on HTV. I produced that show about the vase. I stole the vase, too. Me and my friend Davor got very bored one afternoon and went to that museum. Communists boasted how this was the best secured museum in whole Yugoslavia at the time. But we found that it was quite easy to take a thing or two out, and we did it. We returned the item back to the

museum the next day and we made a joke for radio out of it, pretty much what Buzzkill is doing on MTV (only we did it ten years earlier in a country behind the iron curtain). Luckily we were not imprisoned (although police called us for interrogation whenever some bigger robbery happened). The weird thing is that whenever this museum story' appears somewhere (and it does from time to time in the press or in Radio 101 anniversaries) people in Zagreb remember me - as if I didn't do many more important radio shows: like nuclear power plants or cement factory, or Plomin power plant or Slovenian peace movement and conscientious objection, or interview with Garry Adams in 1986, or discussions about Yugoslav military-industrial machine - nope, all I am remembered as is as a guy who stole that damned vase'.

Ja sam mali, pa sam vrijedan I slusam Radio 101 (I am little and I am busy and I listen to Radio 101 - one of the oldest Radio 101 jingles).

It is important to note that Radio 101 was the only media in Croatian part of then Yugoslavia who had the story for about a year (then Vecernji List published a short note). However, Belgrade magazine NIN gave me a centerfold in their Labor Day (which was on May 1st in Yugoslavia) issue for the story. Why is that important? Mimara Museum was established by a Mimara, a guy who worked with allies after WW II sorting the artwork that Nazis stole from various homes and places during the war. In the process of sorting, Mimara sorted' out quite an impressive private collection for himself. However, he didn't want Yugo-communists to have the fruits of his hard labor. Instead, he kept the collection in Vienna. When he became old and sick his tightwad heart kind of opened a little so he said that he'd will his collection over to the city of Zagreb providing that government guarantees for safety. That's how Museum Mimara was built. The old grumpy lad was never quite impressed by the security of the museum, though, and constantly threatened to take his toys back to Austria. A fact that something was stolen would mean the end of Museum Mimara, if he just knew what happened. But he never learned. He lived three more years after the vase' - and all the time he was surrounded by the security detail keeping good care that he never be told the truth. That's why Croatian media kept hush. Also, that's why Serbian media put it on the centerfold. It was 1985, and the war just started. Tanks were still parked in the barracks, but for intelligence services, journalists and corporate directors it was all out war already. Whatever would make Croatian economy suffer, was welcomed in Serbia and vice versa. Instead of working together to make the whole country better, Republics started bitterly putting each other down in a bid for ultimate power between their inept but power-hungry leadership. At age of 21 this sounded so strange and ultimately illogical to me that I chose not to believe that. Ten years later I still have troubles understanding this ugly undertone of human nature: the insatiable ambition among some to be the One. The wars of the Yugoslav succession - the wars about who would become the Tito in place of Tito - that started then, are still far from over.

Krezubi Trozubac - Spikeless Trident, a weekly political talk show in 1986,7,8,9 which featured a link between alternative rock stations in Ljubljana, Zagreb and Beograd (Hloverka Novak was an anchor, I was one of co-producers)

The fact that so suddenly everybody supports Radio 101 and that a decision that otherwise wouldn't be taken as political is now understood as an intentional political attack, means just that Croats, particularly those 1/4 of Croat population that lives in Zagreb are sick and tired of Tudjman and his autocratic rule. Tudjman, who was once a chairman of the board of the Belgrade soccer club Partisan, when he became Croatian president he changed the name to Zagreb soccer club from Dinamo to Croatia, defending the decision as if Dinamo sounds "too communist". Nonsense number one. Since last Fall Zagreb is a city without a mayor - because citizens in free elections continue to elect opposition candidates and Tudjman refuses to has his capital run by an opposition mayor. Democracy sucks. Now they will let people to buy their own apartments (for Deutsche-Marks, of course) or move out, but they'll reimburse former owners with state bonds. That's exactly what Communists did after the WW II (with that distinction that Commies were content with taking dinars). Those former owners are now going to be proud holders of two sets of worthless bonds in return for their real-estate, while the general population will be more poor, and the window shopping crowd in Zagreb would substantially increase in numbers. And on top of that they want to shut down Radio 101? The only radio that plays rock music? The only radio that give you the uncensored news? The only radio that TELLS JOKES? The only fun left in increasingly bleak Croatian landscape of disabled war veterans and crazed out refugees who lost their homes and loved ones in contrast to $15 long drinks in posh night clubs for half-literate mafia dons who made fortunes by selling bullets to one, two or all three sides during this war, where alliances shifted from morning to afternoon, and loyalty was suffering a high inflation rate. What would be next? Banning water?

No Passaran.

Meanwhile, U.N. mandate in Eastern Slavonia would be extended six more months from January. Good? Bad? Irrelevant. Obviously, Croat refugees are not going to move back in, while their military forces are not there yet. And Serb refugees are not going to leave and move back to their homes in Krajina until they feel safe to do so. So far, despite Croatian government guarantees, they are harassed and sometimes beaten or even killed by locals if they come back. Until they move out from Eastern Slavonia, however, Croat refugees can't move back in there without using force, and therefore the U.N. forces, because Britain and France do not want to allow another Oluja', will not leave the area. This situation can last nearly indefinitely. And Serbs got the better deal since the land in Eastern Slavonia is more valuable than the land in Krajina. So, Croatian refugees are kind of fucked, and they are beginning to realize that, and I don't expect them to like it. Sometimes in future maybe some of them organize an agency to escort and protect Serbs from Eastern Slavonia to their homes in Krajina in return for those

Serbs giving back the houses and land to their Croatian owners. Government doesn't seem to be terribly interested, so I guess citizens would have to do it on their own. This however does not require violence - it is a simple land for security swap, and everybody gets what is his back. It was enough burning houses, it is time to build some.

Cisti Eter (Pure Ether) - a kind of dark talk show which lasted to long in night in eighties; the producer ended up being secretary of Transnational Radical Party in Croatia

Happenings in Croatia were mirrored in Serbia, where Milosevic (not unlike Tudjman) did not want to accept opposition victories on local level - notably in the city of Nis, where tanks were send to quell demonstration in support of winning opposition candidate. Yet Serbia is a bad guy, so we kind of expect such a behavior. It is however soothing to see that both Tudjman and Milosevic are slowly loosing their grip on power. The only unfortunate detail is that Milosevic may live still long years to come. But, as I said - the wars of the Yugoslav succession are still far from over.

Parliament Show - listeners ask a question and 101 journalists go out to investigate, the following week they have an answer; nobody can hide from Parliament Show, Ivic-Paslic better seek asylum in the U.S.

Also interesting is that Zagreb Stock Exchange didn't have any disturbing crashes due to either Tudjman's health, or Radio 101 case - telling probably that ZSE is not an important indicator of what's going on in Croatia, not nearly as important as NYSE is for the U.S.

Interwencija 85 - (intervention 85) the Buzzkill of 101, a situationist project which made 101 a household name; of course - we had read a Constitution in a streetcar accompanied by saxophone and demonstrated with banners with no text (holding silent speeches, too).

BTW, I was banned from Radio 101 in February 1986, when 101's chief editors bowed to the pressure of Party and Police State after my coverage of student protests on Zagreb campus in January and February that year. Regardless of the ban I continued to write and produce shows for quite some time after that, and my friends would give me credit in some funny way not mentioning but hinting to my name. The Communist Party installed chief editors didn't have much sway over people - they couldn't even order a doorman not to let me in. Radio 101 was filled by young people and almost nobody was fully employed. So, the job security was never an issue and the fear of loosing a livelihood never really played a role, and police had less leverage to blackmail producers. Finally, the last editor-in-chief in communist era (who, most interestingly, now works on human rights issues and sometimes even writes for Arkzin) decided to lock himself in his room whenever I came to the radio, so he can tell his bosses that he didn't see me in case they asked. Gradually, however, I stopped contributing, because I couldn't

get paid (a pretty good reason, I believe).

Gostiona - (A Pub - but also a wordplay gost-I-ona: guest-and-her) a guest and her show; her was Zeljka Ogresta (PS - she
always wanted to be a star so much).

After HDZ grabbed power from Communists, they also thought they will run Radio 101 in the same manner and they promptly installed their man in a position of editor-in-chief (a guy whom I remember telling me how good would I look if I just dress in suit and tie; he and his protege were known as a Copo & Glibo duet), but he died of a sudden death - and he was younger than me (I always tried to tell him that suit and tie shorten a man's life but he wouldn't listen to a freak). Before HDZ managed to install a new man, Radio 101 reorganized and accordingly to new free market rules assumed control over their work. HDZ, caught sleeping, since then tries to regain control over the radio station with a carrot and stick method: various goons offered to buy station while the indecision about the license was consistently kept pending over 101's head. Since it didn't work, HDZ reasoned to take the license away from Radio 101 and give it to somebody else, somebody who would more readily dance to HDZ favorite music. Besides, Radio 101 is owned 25% by Zagreb City Council - which is entrenched in a bitter battle with National HDZ ever since Tudjman's refusal to accept any of the elected opposition candidates for mayor of Zagreb. HDZ reasoned that by shutting down 101, Zagreb City Council would loose an important outlet. This is the same reason why HDZ fiercely attacks Novi List in Istra and Feral Tribune in Split. HDZ, in a good old tradition of Communist Party, does not want media - it wants bulletins that would write down brilliant thoughts of HDZ leaders, like Seks, who gets particularly enlightened after the fourth Jack Daniels.

Aktualni 101 - Actual 101 - NEWS - but not just any news:
sound bites interrupted with music and jingles: news for a generation with no attention span (MTV should be sent there for a seminar).

Contrary to sometimes successful propaganda, Croatia didn't change that much. For example, one of those policemen whom I'd always seen around (when they seized my passport, when they searched my apartment without a search warrant, when they interrogated me for more than 8 hours, when they kept me detained without an explanation, when they took away my typewriter...) is now Tudjman's chief of military police. I have to give him some credit - he did seem to be a degree smarter than the rest of them. Also, he smoked a pipe and dressed in plaid suits to look like Sherlock (I always had to suppress laughter when I saw him). When police arrested my roommate at his friends house in Rovinj (Istria) on January 1, 1985, I was interrogated by detective Lausic: my roommate, Goran, was apparently arrested in some case which combined drugs and nationalism - police found some hashish and a Croatian flag on the wall. In those times a Croatian flag on the wall carried a longer sentence than a gram of hashish: my roommate served

just a year for hashish, while his friend was kept for three years in the notorious Goli Otok (Naked Island) prison of Croatian coast for the fucking flag. I managed to convince detective Lausic that my roommate was not into checkerboards' (police jargon for Croatian coat of arms which looks like a checkerboard). I even said that I thought Goran was a Serb. Sherlock Holmes nodded in approval putting his pipe back in his mouth.

Frigidna Uticnica (Frigid Plug) - one of the earliest shows, which was aired in the experimental period early in 1984, featuring such cultural varieties like an out-of-the-closet gay co-producer/co-anchor; the first such show ever behind the iron curtain (no wonder that Tudjman doesn't like 101, Jesse Helms wouldn't like it either).

After being treated two weeks for indigestion in a top U.S. military hospital, Franjo Tudjman, returned to Croatia, where he was greeted by about half a dozen citizens (including defense and interior ministers) gathered in front of Zagreb airport. "We don't want democracy. We want Croatia," one of their banners said. Tudjman, reportedly, promised to deliver. As I earlier said - the wars of the Yugoslav succession are still far from over. Only, now everybody will have more weapons. So, it would be more fun to watch.

Mirko! Pazi, metak!... ssssswiss ...Hvala, Slavko. - another early jingle: "Mirko! Watch for a bullet! [bullet passes] ...Thanks, Slavko." - Mirko and Slavko were comic book characters depicting imaginary teenage Partisan heroes, they were able to avoid Nazi bullets pretty much like Luke Skywalker and Han Solo were able to avoid Dark Empire's lasers. Ah, but however, a bullet has here a lot of different meanings. Keep guessing.

With sincere sympathies, cordially yours,
Ivica Skoric

PS
So far it is 1:0 for 101 in a 101 vs. HDZ fight, and 101 won by TKO in first round after just two days, but a rematch is expected, so keep tuned - go to http://www.peacenet.org/balkans/indie.html#101 (the same page with the latest updates is available on http://www.wideopen.igc.org/balkans/indie.html#101) and link from there to Radio 101 support pages around the world.

Generally, you are unlikely to hear direct communications from the Shuttle as such transmissions are conducted at UHF and SHF frequencies, and often on digital links. However, most Shuttle flights now carry astronauts who are licensed Amateur Radio operators, as does Mir, the Russian space station. Ham astronauts often use Amateur radio for direct contact to schools and, if time permits, directly to amateur radio operators. Off the time of my head, I don't know the exact frequencies used but they are often in the 144.5 to 145.8 range when in use. Postings of some of the frequencies are usually made by www.amsat.org or others on the Usenet ham radio newsgroups.

Some cable TV systems retransmit NASA Select TV. NASA Select TV is also available on Satellite TVRO systems and I believe on "Direct TV" DSS system. Amateurs also retransmit the Shuttle audio over HF radio frequencies (and VHF ham bands in some areas) - these freqs are shown in another posting here.

Here is a subject that may pinch some nerves: "How does your significant other feel about your scanner hobby?"

My ex-girlfriend wanted to run my scanner over with her car. In the 6yrs we were together I purchased 1 scanner. Since we broke up 10 months ago, I've bought 4 scanners and a Opto Scout!

4802. Cell Phone Decoding

RE:<<Can anyone tell me if the Bc 9000XLt is worth the money?>>

Well, worth is a relative term. Everyone has their own opinion of what something is worth. But for me, at this time I love my Bc-9000. I needed the CTCSS capability and I wanted the Alpha memory, however it wasn't practicle for me to get a computer controlled scanner. So, the 9000 was the only logical choice.

Some people complain about intermod and bleedover but from my own experience, it is much less than the BC-890. And I have one friend who uses her 8500 as a door stop.

One thing to investigate would be how likley is it that your department will go to a trunkked system? I have heard rummors that Uniden is comming out with a scanner that will follow trunked systems. I have no real confirmation of it, but it may be worth pokking around before you buy.

But plaine & simple, I love my 9000!

1. Tune your scanner to the wireless mic frequency, turn up the
volume, and wait for the feedback when the 'hooker" comes to your car.

or

2. When the "hooker" approaches your car say something like "forget
it , you don't look that good up close". Then listen to her fellow
officers laugh at her.

Kevin,

Check http://www.execpc.com/~deltacom They have just updated their web
page for the new ICOM 8500. I have their software and it is great for
the serious scanner user.

UHF is usually 5 megs' lower from 450 - 479, so if an input is 455, the output is 450. 480+ is usually 3 megs. However, VHF has no standard., since it's so full. No way of finding it out.. BUT you can now scan around that freq range... =)

douglas@netcom.com (Doug Mason) wrote:

Good answers. But what troubles me the most is that it is against the law to listen to a RADIO! AM and FM are ok but some frequencies are out of bounds. Sounds like the Nazi Storm Troopers work here now!

Beware! There are several software problems
in the DSP-232. The software to fix them was
in beta and scheduled for shipment around
Thanksgiving. I know, I bought one about a
month ago and was looking forward to receiving
the fix. Damn! They'll be giving these things
away before the end of the year.

I have seen an ad for a RELM HS 200 for $239.00. It has 200 channels, pl/ctcss and dpl/dcs decode. It covers 26.0000 to 960.0000 (with the usual execptions).

Does anyone know anything about whether this is a good deal or have any reviews of this scanner??

Thanks

>binary posters to do to get their gems to potential recipients?

I'm not a service provider, just a user, but in my opinion if it has to do with scanners or scanning and is properly identified in the subject and applies to many in the group, there should be no problem in putting them in these area. For one-to-one correspondence, the binaries should be sent by e-mail between the two parties, not here.

4819. McDonald's, Mod & The RCA

Newsgroup: rec.radio.scanner
Date: 1996-11-24 00:00:00 UTC
From: richard@co35pn.demon.co.uk
Message-ID: <3298c153.5172311@news.demon.co.uk>
Source record: 216865

Taken from my local paper Thursday 22nd November 1996

"MoD pulls plug on McDonald's radio"

A radio system used at a drive-in restaurant has been ordered off the air - after apparently interfering with military channels.

Staff at the McDonald's drive in restaurant did not have a nice day when the men from the ministry arrived to pull the plug on their new system.

The radio headsets were delivered to the fast-food outlet just a few weeks ago, but it is understood the Dutch manufacturer had not checked

whether they could cause interference with other British channels.

There were claims today that the radio sets had interfered with the military channels - and left puzzled soldiers from the Garrison getting orders for Big Macs and fries.

A spokesman for McDonald's today said restaurant staff had been shocked when ordered to stop using the radios, but stressed they have received

no complaints about the radio headsets from the Garrison.

"The Radio Communications Agency called in to see us on Tuesday and asked us to stop using a particular frequency for our radio, system so

we did," he added.

A spokesman for The Radio Communications Agency said "The equipment was unlicensed and operated on frequencies which interfered with other users."

: bought mine about 2 weeks ago in Australia and mine appears to be working
: properly.

Maybe you haven't had anything to compare it with?

: Its certainly better than the one that came with the ar1000!

I'd doubt it. I owned an AR1500 before I bought my AR8000, and I quickly
worked out that the AR8000's performance could be improved by replacing its
antenna with the one that came with the AR1500.

Besides the fact that the AR8000 antenna is a lousy RF performer, it's a
bitch to get on and off as it twists right around. Ugh!

Daniel.

4826. Re: What is at 917.7? (Not a cell image AFAIK)

Newsgroup: rec.radio.scanner
Date: 1996-11-24 00:00:00 UTC
From: Tony Dell <tonydell@interactive.net>
Message-ID: <01bbda54$40fdbf20$1be1c0d0@n2hwy>
Source record: 216872

I beleive that 896-901mhz is the range of frequencies that would be used
for the inputs of all 900Mhz trunking systems, the outputs would be from
935-940Mhz which works out to be a 39Mhz offset which is standard for that
band/service.
You might want to listen on 935.300mhz, that would be the output frequency
paired with the 896.300Mhz input that you're picking up the image of at the
917.7Mhz frequency.

Hope that helps!

Tony

Good for you. Stick to your guns. You did the right thing.

In my case, my wife bought me a RS PRO-37 for our fifth wedding anniversary. Great scanner, but I started to outgrow it. Three years later I got myself an AR8000 for Christmas, still used the PRO-37 as the "around the house" scanner, but the AR8000 is the primary one, i.e., my "dress scanner". All the while, my wife thinking the whole hobby is really geeky. Until she started using the PRO-37 to listen to stuff on her own while I was out of town. Then the PRO-37 started to act up (i.e., stop working). AR8000 still going strong, but I needed another "around the house scanner". Jumped on a PRO-50 on closeout for $80 (20 channel job, no 800mhz). Good little scanner, and it's semi-officially my wife's, thus she feels part of the hobby now (I won her over from the dark side).

First real useage for it for her, was when we were in the stands at the OSU-Michigan game this past Saturday - got to listen to the booth announcers on ABC and OSU Football Radio Network with their "interesting" editorial comments about the game while the station was away at commercial. Un-edited is the only way to hear these guys.

Game sucked though, being an OSU grad.

Mike

Gary,

I'm with you. UPS delivers over 12 million packages a day, they have to screw up on someone who has access to THIS newsgroup. I come to this newsgroup for new and interesting information on scanners. I have to sift through 40 posts re: who's got the best COD service to get to the scanner posts. I've never had a problem with UPS and if I did I wouldn't subject the good people of this newsgroup to a blow by blow. Now we have people that are going to post when their CODs are paid. Great! At first I felt sorry for the guy, but after subjecting this newsgroup to this for two weeks I hope he never gets paid.

Lou

=3D=3D=3D=3D

Note from the author: I'm sorry I didn't publish this information sooner.
I've known of the extended capabilities of this radio for a couple of years=
=2E
I made a few attempts to make deals with various radio mod shops. Most fel=
t
the time needed to make key pad entries was too long to make a profit. I h=
ope
you'll enjoy the added coverage of the radio, and forgive my belated releas=
e
of this information.

If you have questions, I will try to answer them via e-mail.

Please, feel free to share this information with others that own one of the=
se
fine radios. I would appriciate it if you included my call sign with all
copies of this information.

-Al n8kli@aol.com

PRO-43 Shortwave & Extended Receive
Al Mellon N8KLI

(This modification is only possible on radios able to be modified to receiv=
e
the full 800 MHz range.)

Scope and nature of the modification: To allow the PRO-43 to receive
frequencies from 6 MHz to 1000 MHz. This is accomplished by setting the PR=
O-
43 to non-standard splinter frequencies, the CPU will then step the radio
beyond the normal band edges. To derive the non-standard splinter frequenc=
ies
it is necessary to change the diode configuration matrix, and to use the
monitor-search function. The hardware modification should take about thirt=
y
minutes. The remaining programming / search will take as little as 45 minu=
tes
(depending on how interested you are in the signals you encounter during th=
e
806 MHz to 30 MHz search to be run).

I claim no responsibility for any damage done to your radio by attempting t=
his
modification. I will also not be responsible if you use this radio to brea=
k
the law by monitoring cellular mobile telephone transmissions.

Anyone attempting this modification should be comfortable working with surf=
ace
mounted components and have a reasonable familiarity to the key pad functio=
ns
of the radio.

STEP 1 (DRAWING 1)

- Remove the antenna

- Remove the battery pack

- Remove the four screws (A)

- Remove the rear cover

STEP 2 (DRAWING 2)

- Remove the six screws (A)

- Using a knife blade, pry the connector at the bottom of the circuit board=

apart (B)

- With the connector (B) apart the top circuit board can be pressed side to=

side to allow removal of the two hidden screws (C)

- Lift the two stacked circuit boards (watch the connectors on the right ed=
ge
of the main board)

- Swing the two stacked boards to the left (as shown by the arrows)

STEP 3 (DRAWING 3)

- Remove the RF shield by heating the four solder pads (A) and GENTLY pryin=
g
the shield up at the corners. Watch for any surface mount components!

STEP 4

- Note the location of diodes D1 - D5 (factory U.S. configurations has dio=
des
D1, D2, D4 in place).
See DRAWING 4

Diodes D1 - D5 enable the following functions
D1 - KEY LOCK switch enable
D2 - 30 MHz to 54 MHz enable
D3 - 54 MHz to 88 MHz enable
D4 - Cellular lockout enable
D5 - Cellular 12.5 KHz step enable

The normal broad band coverage modification (DRAWING 5A) has D1, D2, D3 i=
n
place providing the following coverage:
30 MHz to 88 MHz
118 MHz to 174 MHz
220 MHZ to 512 MHz
806 MHz to 999.9875 MHz
(30 KHz cellular channel spacing)

If your radio does not have D3 then move D4 to position D3

D5 should not be in place

See DRAWING 5B. Solder a diode - cathode side (has the line) to the uppe=
r
side of the D5 position. Make sure that the leads are the proper length =
to
allow this new diode to sit on top of D2 and D3, and that none of the leg=
s
touch. Solder the anode side to the lower side of the D1 position.

Installation of this diode allows the user to select the channel spacing =
in
the cellular bands. KEY LOCK off at time of power on yields 30 KHz spaci=
ng.
KEY LOCK on at the time of power on yields 12.5 KHz spacing. By using th=
e
monitor memory and changing this configuration in the middle of a search =
in
the cellular band we are able to derive non-standard splinter frequencies=
=2E
This seems to evade the CPU programming of the allowable band edges,
allowing the radio to search beyond normal frequency coverages. At 30.00=
5
MHz, the next downward frequency (at 5 KHz steps) is 30.000 MHz. The CPU=

then realizes it has reached the lowest valid frequency, so that the next=

step down the operating frequency is set to 999.9875 MHz. We will store =
a
frequency of 30.0025 MHz in channel 200. Using the DIRECT feature of the=

radio we are able to tune to a frequency above or below any stored
frequency. The CPU reads 30.0025 steps down by 5 KHz and is now at 29.99=
75.
Since the frequency still does not equal 30.000 MHz it is able to step do=
wn
again. 29.9925 MHz - you probably get the idea. At 2.5 KHz it does jump=
up
to 999.9975 MHz and then to 895.9875 MHz. (Sensitivity drops below 15 MH=
z,
but remains useable to about 6 MHz.) In the procedure below you will stor=
e
band edge frequencies that can be stepped above or below to grant added
coverage. The CPU will not store in memory any frequency outside of the
permitted coverage. This necessitates the use of the direct mode.

STEP 5

- Reassemble the radio

STEP 6 Keyboard entries

- With the KEY LOCK switch OFF turn the radio on. The unit will now step b=
y
30 KHz steps from 825 MHz to 845 (cellular mobile input channels - base
channels are 870 MHz to 890 MHz)

- Set the squelch to open (MIN) and volume to low

- Enter to the key pad

PGM LIMIT 30 ENTER LIMIT 825.120 ENTER

DOWN LIMIT DOWN MON

(The display should read 825.120 down search)

- Turn the KEY LOCK switch ON and turn the radio off

- Turn the radio on and set the KEY LOCK switch to OFF

- Enter to the key pad (Squelch should still be open.)

MANUAL MON DIRECT DOWN

(The display should read 825.1075 down search)

- Close the squelch to allow the radio to search down.

- Use the UP DOWN and the squelch control to stop the radio at 806.0075 =
MHz

- Enter to the key pad

MON PGM 194 PGM MON ENTER

(Channel 194 has now been programed with 806.0075 MHz)

DIRECT DOWN

(The display should read 805.9950 down search)

- Close the squelch to allow the radio to search down.
(I've noticed birdies in the 560 to 700 MHz range.)

- Use the UP DOWN and the squelch control to stop the radio at 511.995 M=
Hz

- Enter to the key pad

MON PGM 195 PGM MON ENTER

(Channel 195 has now been programed with 511.995 MHz)

DIRECT DOWN

(The display should read 511.9825 down search)

- Close the squelch to allow the radio to search down.

NOTE: From this point on, I have listed frequencies that you most likely w=
ill
program to your radio. If your frequencies are not exactly the same, they
will work as long as the last small digit is a 5 (.5 Khz), and the frequenc=
y
is within the normal allowable frequency band limits. By this time you hav=
e
probably noticed that the search step is per the next valid band the radio
will encounter in the direction being searched.

- Use the UP DOWN and the squelch control to stop the radio at 220.0025 =
MHz

- Enter to the key pad

MON PGM 196 PGM MON ENTER

(Channel 196 has now been programed with 220.0025 MHz)

DIRECT DOWN

(The display should read 219.9975 down search)

- Close the squelch to allow the radio to search down.

- Use the UP DOWN and the squelch control to stop the radio at 173.9975 =
MHz

- Enter to the key pad

MON PGM 197 PGM MON ENTER

(Channel 197 has now been programed with 173.9975 MHz)

DIRECT DOWN

(The display should read 173.9925 down search)

- Close the squelch to allow the radio to search down.

- Use the UP DOWN and the squelch control to stop the radio at 118.0225 =
MHz

- Enter to the key pad

MON PGM 198 PGM MON ENTER

(Channel 198 has now been programed with 118.0225 MHz)

DIRECT DOWN

(The display should read 117.9975 down search)

- Close the squelch to allow the radio to search down.

- Use the UP DOWN and the squelch control to stop the radio at 87.9975 M=
Hz

- Enter to the key pad

MON PGM 199 PGM MON ENTER

(Channel 199 has now been programed with 87.9975 MHz)

DIRECT DOWN

(The display should read 87.9925 down search)

- Close the squelch to allow the radio to search down.

- Use the UP DOWN and the squelch control to stop the radio at 30.0025 M=
Hz

- Enter to the key pad

MON PGM 200 PGM MON ENTER AM/FM

(Channel 200 has now been programed with 30.0025 MHz AM)

To listen to Rush at noon on WRNO 15.420 MHz

- Enter to the key pad

MANUAL 200 MANUAL DIRECT DOWN

- Use the UP DOWN and the squelch control to stop the radio at 15.4155 M=
Hz

- Use the UP DOWN and the squelch control to stop the
radio at 185.7575 MHz

- Enter to the key pad

MON The radio is now locked to the correct frequency
(the AFC will lock the radio to 185.760 MHz)

To listen to Civil Air Patrol on 26.620 MHz

- Enter to the key pad

MANUAL 200 MANUAL DIRECT DOWN
- Use the UP DOWN and the squelch control to stop the
radio at 26.6125 MHz

- Enter to the key pad

UP (The display will now read 26.6175)
MON The radio is now locked to the correct frequency
(the AFC will lock the radio to 26.620 MHz)

STEP 7

- Ask yourself why Radio Shack did not include shortwave or extended VHF
coverage in the PRO-43 software.

Answer: They wanted to sell you a shortwave receiver too.
- OR -
They've just grown accustomed to following the leaders, not bein=
g

one.

Notes:

*****> It is necessary to drop below the desired HF band frequency and then=

search up to re-enable the VHF-LO band circuitry. None of the other bands
require this. <*****

The lowest frequency I've been able to copy with out modification of the RF=

cicuitry is 5.8 MHz.

The best SWL sensitivity is from 15 MHz and up. I use my 2 meter 5/8 wave =
HT
antenna for SWL and have good results from my office. As with all rigs, an=

outdoor antenna works far better than an undersized rubber duck.

When listening to 10 meter FM check your mode.

If the key pad operations must be interupted, it is not neccesary to restar=
t
the programing from 825.120 MHz. Simply go to the last memory channel
programed with a non-standard splinter channel in the manual channel mode.
Then enter to the key pad

DIRECT DOWN

This will restart the search from the last possible frequency.

Steps to enhance the HF receive sensitivity.

- Remove L101

- Add the following circuit

Hi!
I have a BCT-7, have no experience with the BCT-10 except for what I've read....

The BCT-7 is perfect for the car. I think too much is made out of the "highway patrol alert", which really is not useful, and it makes scanning the police frequencies maddening! It checks the "mobile extender frequency" frequently, going off the scanned police frequency for about .25-.5 second. That does not make listening to the police much fun.
Advantage: If you're like me, you spend most of your time in your town or city, and have local police, fire, etc. that you scan primarily. In the BCT-7, you can program all of the local frequencies, and scan them as your "private" bank. When you go out of town, you can switch over to the database of police frequencies programmed into the BCT-7. You do not have that ability with the BCT-10. While you are in town, you end up having to scan through perhaps hundreds of frequencies to get back to your local police frequency, missing numerous transmissions. You may also lock on to weak distant transmissions, which are not of interest anyway!

I am a radio enthusiast, and have about 10+ scanners along with my amateur radio equipment.

The BCT-7 is the answer at the present time for mobile monitoring!

Cops around here use cellular phones quite a bit to talk about stuff they don't want over the air. The problem is that theoretically they could easily be picked off on the scanner if it was legal. I hear our Dept is on Wireline B which is supposedly not very busy in the evenings. I'd listen in to see if this was true but it's illegal.

I am looking for frequencies used in and around Rich Stadium while the Bills are playing home games...

I am most interested in:

Local Law Enforcement (especially that helicopter flying overhead)
NFL/Bills administration
Security
Parabolic Mics/wireless mics used for broadcast/NFL films
The TV production company
Other broadcast stuff for the game

Please reply here and my e-mail: mailto:nessman@servtech.com

Thanks!

> '73 JIM

I was told that the unit comes from optoelectronics with software
that allows the unit to be programmed for various frequencies. Further,
PerCon provides a 20digit code, that when used with this software will
permanantly unlock the unit for the 800-900MHz band blocked freqs. In
order the re-block them, you need to use to use the code and the software
again.

Based on this information, I have just about decided to purchase the unit,
antennas, carry case, etc.

My question: Does anyone have information that disputes what I have been
told? If you do, please describe the information you have, and where
you got the information.

Thank you,

Dan

It's amazing to me how, when COngress wanted to pass laws regulating the Internet, everyone touted how it's an anarchy, and CAN'T be regulated.

But then, one or several people have taken it on themselves to create robots to cancel posts that the robot creator NEVER read, or had any intention of reading, AND that the majority of readers of the groups where the posts ARE getting cancelled did NOT ask for any help in 'policing' the group.

... Digital circuits are made from analog parts.

I am to understand there is a mod for the Pro2028 which will allow it
to retain it's memories after it's been turned off for some time.
Could someone please repost (or preferably email me) the info I
require.

Thanks.

From: Joe Allen <zigy@teleport.com>
Message-ID: <329946C6.494D@teleport.com>
Source record: 216894

I was wondering why radio shacks specs say that the pro 39 is cell blocked when mine gets it just fine says on the back that the valid freqs are not modifyed. It says the freqs are =806-823.9375, 851-868.9375, and 896-960, this info leads me to belive that is not modified (plus that I bought brand new from radio shack).I was also wondering if there is any Mods or keypad tricks for this radio and is it any good of a unit. its made by Genral reasearch Electronics for radio shack too.

A response would be greatly Apreaciated. thank you

I have a 2040 that I use as my base scanner and I like it. I live approx 20 miles from the airport and occasionally hear ghost transmissions from the plane to ground on a couple of the police frequencies. When that happens I hit the scan button. I can hear many of the replies from the cars of several of the local police departments which I enjoy hearing. I also pick up cellular phone calls between 896 and 915 mHZ. I don't know if they are ghost images or not, they aren't picked up by my Pro 62 which is triple conversion vs the 2040 which is double conversion so perhaps they are ghost images. I'm using the RS coil antenna in place of the antenna that came with the unit, I think the RS antenna improves reception.
I bought mine on sale and have been satisfied with it, I know its not triple conversion but for what I listen to which is local Public Service frequencies it does a good job.

Source record: 216578

The first thing you want to do is push the "program" button (surprise)
then push "limit".
At this point you have the option of choosing which preset you want to use,
the options are 0-9. For this example lets just go with "1" , after hitting
"1" you should see
(L 1 XXX.XXXx) this is the "low" frequency of your search range. At
this point just put in the start or low limit freq. once you do that hit
enter. Now that the low freq is programmed hit limit again, now you should
see this (H 1 XXX.XXXx) , now put in the high freq. of your search
range and hit enter again. That's It! Now just hit the up or down arrow and
off you go!
One thing to remember is that you have 10 presets 0-9 that can hold any
search range you put in them and while you're in search mode you can just
hit 0-9 at any time and it will begin searching whatever range you have in
there.

Happy Scanning!

Tony

And I too just now received an update in the mail. EPROM, not EEPROM. Parts are labeled "AEA V1.0 L31". Level 31? Instructions dated 10/24/96 say "This upgrade enhances your DSP-232;s ability to function in Amtor, Pactor, 9600 bps Packet and 9600 pbs KISS mode."

Just thinking, if AEA can't find a buyer for their intellectual property, it sure would be nice if they'd post the source code to the DSP-232. One of the reasons I purchased a DSP-232 was that it has a very powerfull CPU (MC68340) that can be programmed with free tools (gcc and gdb), and AEA's advertising copy showed a picture of their PCB including the jack for connecting Motorola's Background Debugging Mode. Alas, haven't had time to play with these toys.

Well I guess I should apologize. I received my new firmware
today. The package was postmarked 12/21 and the software had
a date of 12/6. I installed it and noticed the signal analysis
still seem to have a problem. I'll take what I have (many new
modems) and put up with the minor things. Whew, I thought I
was screwed. Thanks AEA!!!!!! Hopefully they will not go the
way of Lafayette, Heathkit, and the real Radio Shack.

I just purchased the Xplorer directly from Opto and if you read the
xplorer.txt file that describes the CI-5 interface protocol, somehow,
mysteriously I'm sure, right at the end of the file it contains the
CI-5 command set used to enable/disable the Cellular band block
required by the U.S. Government on all U.S. domestic sales.

What I'm looking for is a -complete- list of CI-5 commands that the
Xplorer will respond to. The list they provided only includes 13 sub-
commands that READ data from the Xplorer, nothing about WRITING
data, except for that treatsie I mentioned above.

While this may in fact indicate secrecy, it's more likely a range control order to 'shut up and listen', similar to the International Silent Interval or our local PD's Signal-67. I'd suspect a high risk test where emergency communications or telemetry must not be interfered with.

If I read between the lines, I think I can answer your question.

No, it does not cover cellular, and yes it can be modified to
cover cellular. It takes about 20 to 30 minutes to do. A little
more complicated than other scanners, but still pretty easy.

If you find one, please note that it is an excellent scanner. I have
had almost no problem with mine whatsoever.

Dan

Just wondering if anyone happens to know, or be interested in knowing
the frequencies for the Canadian Security Intelligence Service, and
the Communications Security Establishment?

Tucker Electronics was also carrying them in their last catalog. Their
number is 800-559-7388. I've been pleased with their service in the past.

Got my service manual from RS earlier this year for my PRO2004. Had to
order it (of coarse), and it took 3 days to get it.

Built one of those 10 LED signal strength meters and it works great!

Naw. It's okay to listen to Star-106FM if you have an amateur radio
license, or, you're a certified alarm system contractor, or, you have
written permission from your local Chief of Police.

Then Bandplan (Freq, Mode, Step size Etc.) is stored in the system area
of the AR8K's EPROM. You can't change it from the keyboard (as far as I
know) but many of the PC software control programs let you modify it by
downloading a new bandplan to the radio. Haven't found a good one
yet...still looking.

Source record: 216678

This scanner is well worth the mail-order prices these days
which run in the $340-$350 range.

500 channels, 20 banks, 100 channel/sec scan, 100/300
freq/sec search, 50(?) search pass channels, 250 channel
alpha-numeric tagging, adjustable step size and recv
mode, count memory, CTCSS capable, auto-store, tape
recorder output control and your typical per channel
lock-out, delay, attenuation, etc. and the rotary
tuner is great.

Very good sensitivity with intermod rejection that's
just a tad below the Pro-2006. Selectivity is not as
good as it should be(IMHO).

I personally do not care for the "dot-matrix" LCD
but it is large and well lite.

Strong signals,
Rich Wells

If you want a pre-programmed bandplan to upload to your radio, Scancat gold will do that. Radio Manager for Windows and Scan*Star Commercial or PLUS for Windows will allow you to edit the AR8000 band plan. Radio Manager has the BEST editing feature for the AR8000 EEPROM that I know of!

http://www.scancat.com/

http://www.scanstar.com/

http://www.interplaza.com/bensware/

These sites have demos for you to play with!

You will need an interface, Either an OPTOLYNX from Opto, a CAT-232 from Scancat or an AR8000INF from EEB

http://www.access.digex.net/~eeb/eeb.html

http://optoelectronics.com/index.html

That should give you a good head start!

Sounds a good deal Jim but may I add a small caution.

Some of the "AA" size batteries in the higher capacity ratings are a
fraction wider in diameter and to get them in to a 8000 means a wee
bit of extra pressure.

The battery back cover may allso have excess pressure placed on it and
the "catch" holding the cover of can crack or give way. Keep your eye
on it.

>
> Anyone have the Uniden 890 XLT base scanner? how ya like it?

It's not as sensitive as I'd like, but sensitivity in a congested area is a bad thing (tm). I really like the CTCSS board option; it saves me a lot of problems with intermod. Without it, aircraft come in on high band.

There's a bug in the Line Out (to a tape recorder or whatever) that requires you turn up the volume to get any useful output. The tuning knob is handy. The Priority function can chew up a lot of time if all the banks are turned on, since it checks each bank's prioritized channel, but it'll let you prioritize any channel in a bank.

The LCD is hard to read from a low angle. I have mine on the fridge and can't read it from more that a few feet away. But overall, it's an OK unit.

From the FAQ "Buying a Used Scanner:"

PRO-2040: late 1995 vintage 100 channel base made by Uniden.
Fair performance, but minimal image rejection. Local
oscillator harmonics account for spurious responses, e.g.,
reception of cellular telephone calls in the 460 MHz UHF-
high band. Scans over 40 channels/sec. Can lock out up to
50 channels from search. "Soft" on/off power switching via
keypad. See "The Radio Shack PRO-2040," by Bob Parnass,
AJ9S, in Monitoring Times, December 1995.

4913. Clicking between channels.

Newsgroup: rec.radio.scanner
Date: 1996-11-25 00:00:00 UTC
From: S.A.mcilravie@hw.ac.uk
Message-ID: <57ckcb$ceo_001@hw.ac.uk>
Source record: 216698

I have an AOR Scanner that is fairly old. I often just scan the channels I have saved in the channel memories. Does anyone know how I can stop the infernal thing 'clicking' everytime it moves to a new channel (ie twice a second). I'm a poor student, so I can't afford a new one!!!

I've had the squelch turned up full, but still it persists.

Any comments greatfully received.

Hi Kevin:

Take a look at the Delta Research WEB page at
http://www.execpc.com/~deltacom which I believe is what you're looking
for.

Our DELTACOMM I-8500 Communication Manager (production version) is
available for immediate delivery. To allow our customers access to
future program updates (NOT DEMOS), all they will have to do is log into
our WEB site and download the current production version.

The DELTACOMM I-8500 communication manager has been designed
specifically for the ICOM IC-R8500 receiver and therefore addresses all
the professional features your radio has to offer. DELTACOMM's QUICK
LOG function will log signal level, frequency, mode, date, time and
optional Global Positioning System (GPS) coordinates at speeds in excess
of 2400 channels per minute.

Some of the DELTACOMM I-8500 communication manager features are:

+ Separate volume level settings for each frequency while scanning.
+ Signal level logging.
+ Control of receiver's attenuator while scanning.
+ program your receiver's 40 channel memory bank (INCLUDING ALPHA
NUMERICS) in 3 seconds.
+ CYBERSCAN feature used to track systems employing frequency hopping.
+ Priority channel monitoring - sample rate approximately every 2.5
seconds.
+ Optional active frequency handoff able to control 125 ICOM receivers.

Your purchase of a professional communication receiver deserves
professional software and you will never regret buying the best.

4915. RE: Denton, TX freqs???

Newsgroup: rec.radio.scanner
Date: 1996-11-25 00:00:00 UTC
From: George Joos <joos@ibmoto.com>
Message-ID: <3299D1FC.41C6@ibmoto.com>
Source record: 216700

Hi Cleve,

I looked in one of my references (Monitor America, 3rd Ed) and they
had the following for the city/town of Denton:
856.3125 - 860.3125 in 1MHz steps
If Denton is like my area in TX the county and city could be sharing
the same 800MHz channels, just different talk groups. I have heard
Round Rock and Williamson county both sharing the 800MHz I have listed
only to Round Rock.

Another database I pulled of the net awhile ago listed some more
stuff, but I do not know how reliable it is. It lists local gov't
to be using:
856.2875 - 860.2875 in 1MHz steps
856.3125 - 860.3125 in 1MHz steps
In addition it lists the police department with the following specific
channels:
A 853.0625
B 853.9125
C 854.5625

Good luck with these 800MHz listings. The book also listed several
VHF freqs (mostly 150's and 450's range) that might be in use. Let
me know if you want those posted also.

George

Thanks for keeping me honest Jonathan! I don't follow radio-type
developments and laws in the UK too often, but I thought there
rules governing manufacture of scanners capable of listening to
the UK cellular frequencies? Perhaps the laws don't cover the
manufacturers but only the listener? Wondering if you can set
me straight here? Thanks!

P.S. You guys got any of those MVT-9000s in yet? ;-)

Strong signals,
Rich Wells

I haven't found the perfect scanner, but some of the current
models are pure pleasure to operate.

The PRO-2042 is a very good scanner and I was impressed with
the one I tested.

However, my favorite base scanner remains the Uniden/Bearcat BC9000XLT.
I own two, each equipped with the extra-cost CTCSS decoder.
I think it's the best current model scanner even without CTCSS.

There are 20 banks of 25 channels each -- just the right size.
I have a few banks programmed with various local police, fire,
and businesses. The other banks are programmed with
federal agencies, e.g., one bank with Immigration,
another with Customs, US Marshall, DEA, etc.

I program Alpha labels for many channels so I know at a glance
what I'm on without having to look it up in a frequency list.

The feds sometimes employ digital scrambling. The CTCSS feature
permits me to scan continuously, hearing only transmissions "in
the clear" while skipping over the annoying sound of DVP.

Also, I like the new ICOM R8500 DC - 2000 MHz general coverage
receiver. It works great as a communications receiver,
though the BC9000XLT is a better scanner.

Consider a PRO-2042/Opto board/PC setup, too.

Ye publique notice! Harken! Behold! Hear ye, hear ye!

```
+=========================================================+
| Now available: APFTools version 3.01 by Reid Drummond |
+=========================================================+
```

APFTools is a frequency data extractor for text files, (random, chaotic, or organized) that contain listings of frequencies. Such text files could be e-mail, newsgroup posts, forum messages and posts, and even BBS/Internet files where people compose and upload lists of their favorite frequencies.

Text lists are fine so long as you're the pencil & paper type of data user, but what if you use spreadsheets or database managers to store and track vast holdings of frequencies? If you work in the modern ages, then you'll know it's not a lot of fun to manually extract frequency lists for your databases.

APFTools makes quick work of extracting frequency information from text files, even if there is no sense and order to the lists. APFTools pulls frequencies and related ID information out of the mumbo-jumbo text file and creates any of several types of compatible output files, ready for import by spreadsheet or database manager programs.

APFTools also creates AuotProgrammer (*.APF) files for the CE-232 Scanner/Computer Interface in the twinkling of an eye. Gone are the days of manual labor in editing text files to the comma-delimited ASCII format needed by the CE-232. Just feed APFTools a list of frequencies in any order, and out comes the *.APF file ready to go into the CE-232.

Even if you don't have a CE-232, APFTools could be down your alley since it creates output files that are recognized by most spreadsheets and database manager programs.

APFTools is shareware (try before you buy), the cost of which is a paltry $5 to Mr. Drummond, the author, if you keep using the program after the trial period.

The APFTools file details are:

APF301.ZIP 256532 11/13/1996 07:53

APFTools is available as follows from the following sources :

```
============================================================
```

Compuserve HamNet Scanner File Library: GO HAMNET

FTP sites: ftp://ftp.cts.com/pub/bcheek
ftp://ftp.cts.com/users/crash/b/bcheek

Hertzian Intercept BBS: (619) 578-9247 after 5:30pm and
(in the FREE file area) before 1:30pm, PST. (BBS closed on
weekday afternoons)

APFTools can be freely distributed in its original archive, and
so may be available at other sites as well as those listed above.

If you can't obtain APFTools by any other means, I can mail it
to you on 5.25" disk for $8, $5 of which goes to Mr. Reid Drummond
as pre-registration for the program, and $3 to cover the cost of the
disk, mailer, postage, and handling. It is strongly suggested that
you should exhaust all other possibilities before ordering the disk,
which is offered as a public service - not as a profit enterprise.

I think that the Navy at China Lake is wiseing up!
This morning, I heard them talking on the Range Freq,
and they mentioned that they will have a "Radio Silence"
between 0900 and 1100 "for this event." This tells me
that they are testing a "secret" weapon that they don't
want anyone to know about. While "secret" stuff goes
on all the time out there, this evidently was just a
little more secret than other tests. (Much like just a
little bit pregnant) There may be a
hundred or so Scannerists out here in town, some more hard
core than others. And I'm sure that someone on the Base
is monitoring the Internet for traffic just like this, and
are taking appropriate precautionary measures.

That's GOOD! I firmly believe that if they don't want
people listening in to them, then they should either
scramble or go silent.

I'd bet not. If the Navy really doesn't want anyone to know whats going on, they'll go encrypted, HaveQuick, etc. Most of the time they really don't care what you hear. It's not like your getting telemetry off their test birds. As for a SECRET test I doubt it. Why alert everyone? If they were doing some secret stuff, they'd keep up normal radio traffic and sure wouldn't come over the net and say "radio silence"

>>First In FLORIDA it is against the law to have ascanner mobile.

As written, the law has enough loopholes to drive a Mack truck through. It is illegal to "install" such equipment in a vehicle. That means a hardwired PRO-2006 is illegal...but a handheld PRO-43 is not, since it is not "installed" in the vehicle.

And yes, licensed amateur radio operators of all classes are fully exempt from the law.

I have 3 scanners. The BC890XLT was my first (without tubes and plug-in coils anyway). It's interesting how some folks hate the BC890, claim it's deaf, etc. I've been happy with mine. As with most things it has strong points and weaknesses. I sometimes have all 3 scanners going at once and sometimes it stops on activity the others just cruise on by, sometimes it misses.
I use it mostly for for "new" frequecies I want to check out. I punch in the freqs. and let it scan and count the hits. If there's lots of activity on one or more of them I punch those into my AR8000 and monitor them at work and mobile. It's the only scanner I have that counts hits without a computer connected, and I like the convienience of just turning it on, selecting the channels to scan and letting it count away. You can put in occasional use freqs. and tell at a glance when they've become active.
Can't say much about intermod since I am rural and never have used it mobile. Seems to perform adequately in the VHF and UHF public safety bands. Haven't used it for aircraft much so I can't comment about the AM performance. Gets LOTS of images from cellular, kind of annoying trying to sort them out from the trunked public safety freqs. at times.

>I've bought 4 scanners and a Opto Scout!

I ordered my first scanner in 1984 when I was in the Air Force stationed in Okinawa. Since I really didn't have a clue (at the time) what freq ranges I would need to get military traffic in a foreign country I chose a scanner that had a very broad range. I chose the Regency MX7000 which had complete coverage of 25-550 Mhz and 800-1300 Mhz. Needless to say it was NOT cheap. My then fiancee (now wife of ten years) didn't have a clue to what it was or way I had to have it. After it arrived and I found the MP freqs and started listening to all the domestic disputes and drunks she couldn't get enough!

She had to return to the states 6 months before me, so she made me go out and get her a scanner and program in all the local law enforcement freqs. After ten years we still enjoy listening to it together.

Brian,
Yes they do. I have both a Radio Shack Pro-29 and a Bearcat BC230XLT and
both will pick up cells equally well. Actually not that well, after all, it
is an image, but well enough to listen... which I never do of course.

Hi Brad,
Hit Program,pick a bank number that you want the search to be in,
(you have 10 search banks),Limit,enter the lower freq, hit Enter,
Limit,high freq, Enter, then the up or down arrow, and away you go.

Only once have I ever heard an interesting conversation over the Cell Phones.. Back in my old hometown I heard a Drug Deal being setup for some Cocaine to be completed at the Local Mariott Hotel.. Other than that all I ever hear are lover spats and stuff like that. That Coke deal was in 1991 never heard another interesting thing and stopped listening to em in late 91 due to boredom with the type of conversations.

It is worth having Cell Phone for that 1 interesting call.. I would still want cell phone reception ability in any scanner I get.

Most cops where I am now use their 800 Mhz Radio phones and ya get more interesting stuff there. The radio phone happens to be on 855 Mhz so no problem listening to it :)

>

Well I wouldn't know, ofcourse, since listening to cell-phones is illegal- and I would never do anything that the government told me not to.{ROFL} But I would suspect the more interesting times to listen is late night- especially weekends when rates are cheap or even free.

>> business. You not only endanger yourself, but the officer as
>> well]

Vice busts are some of the most comical operations which
the cops get to perform for....especially the undercover
fem....she is not supposed to "entice" or "say suggestive
come-ons's" to a prospective JOHNNY. She supposed to be
limp and approachable...he takes the "initial thrust" at
her "being noncommital".....that is the theory.

Vice cops can arrest anyone who talks to a prostitute for
up to 24 hours....just because you spoke to one....the
Free Speech and Freedom to Speak to Whoever One Desires
dont' apply in these procedures.

You talk to the prostitute, you are guilty and will be
approached and they will photograph you and take your
prints...(they have this new device that does it) ...justd
because you said "hi, how's tricks?"

What you should know is that the cops can "confiscate your
car" and tomorrow it is inventoried and sold to the highest
bidder in some states...this is how they get REVENUE for
the city....just for talking to a Prostitute who just so
happens to be a cop....

Civil Rights and the Constitution's Bill of Rights are justd
laughed at: they need money and this is the safest way to get
it for a No Crime act....open your mouth and you get arrested.

This is the way it is.

Anyone who is stupid enough to engage in talk and let the cops know you are ON SCAN deserves what they get....there are better ways to do it. We photojournalist's do it all th etime and don't get arrested. And we get video or stills.

I would *suspect* it's the time of day one listens to the cheating
wives (husbands) , drug deals, lovers fights, hookers directing their
clients to where their van is parked, corrupt city officials etc. I
would *suspect* good times to listen would be after 6 or 7 PM during
the week and from midnight on, on the weekends , especially right
after the bars close. Of course I would never do such a thing ;)

Reading off the back of my PRO34:

30-54, 108-136, 136.005-174, 380-512, 806-823.9375, 851-868.9375,
896.1125-960mHz.

Hope this helps.

Scott

+Any idea what it means , why it is happening, and how to get priority

+to work properly?? Steve.

If Priority is selected then there must be one priority channel
programed. If you try to move it you will get the error message.
I think you can get that message also if you try to lock <pass> those
specific channels with priority selected. Remember only the first
channel in banks A - J are automatically priority channels.

Describe it? Do you remember that little robot in the "Buck Rogers"
TV series? <G> Seriously, it's not that easy to do in words.

However, I can tell you that if you are tuned to one of the big paging
company's frequencies, you probably won't get anything. Most of them
have since gone to 1200, 2400 POCSAG, or the new FLEX protocol. Rene's
program only decodes 512 pocsag at this time.

902-928 is home to a whole bunch of unlicensed, part 15 technologies.
Including analog cordless phones, which you could have come upon.
Amateur radio is another secondary user of that spectrum (at least for
now).

896.3 Mhz is a channel used by mobiles in 900Mhz conventional or trunked
systems. It would be paired with 935.3 Mhz.

Then again you could have been hearing a spur from something... no
telling. Who knows?

Regards

-> happens to be a cop....

I don't want to belabor this point (it's a bit off topic now), but this information may be correct for some jurisdictions, but by all means, not all.

To be arrested in California, there must be a solicitation, that includes the specific discussion of sex in exchange for money, or something of value (Refer to CA Penal Code Section 647b if you are interested).

Several jurisdictions have enacted local laws to confiscate vehicles driven by the customers, but this is not State wide.

My only comment echos the one already in the newsgroup; if you see a law enforcement operation in effect, stay away and don't get involved. If you knowingly interfer, you could be arrested, or worse, be injured in a situation that you don't know what is REALLY happening.

Take care, stay safe and happy listening.

What the person did, and plans on doing is very foolish!
This person could get caught up in a very dangerous situation.
What the Cops are doing is not a game. Around here you can be aressted for
interfering with official police business, or obstucting an Officer.
Almost anywhere, there is some law that could be used against against you to prevent
this activity.

This is the reason anti-scanner laws come to be in the first place.

Download the free scanware NY database and go to town!
Here are some I got from there..
154.6 42 handhelds
467.65 44 handhelds
467.075 44 handhelds
467.9
462.075
under the following callsigns (for easy lookup)
KB44181
KNIA620

On my own I also found the Ref's wireless mic freq, 195.8

Have fun and tell me what you hear and if you find anything else.....

It depends on what model. Any dual-conversion scanner will
pick up images. Triple-conversion scanners are more immune,
but under some conditions MAY pick up certain image
frequencies.

Thanks for posting to the thread. I couldn't find it and I
wanted to post a correction.

The readme file still refers to version 1.12, but version
1.14 is indeed a different version of the decoder.

I've had no luck decoding anything, but I'm not even sure
that the traffic I'm hearing is POCSAG mode. Can somebody
describe what a POCSAG signal sounds like?

The excellent railroad frequency page at
http://ux1.cso.uiuc.edu/~roma/rr-freqs.html seems to be down, but
accordin to Kalambach's "American Railrod Frequencies" book, Amtrak
uses these road frequencies on the Northeast Corridor:

160.920 - Washington to NYC (includes wreck site)
& New Haven to Boston

161.280 - NYC to New Haven

I've got a BC2500XLT, triple conversion unit, and it gets many images,
enough to be anoyning (especially that darn trunk control channel buzz).
I went triple conversion to get away from images, but in the 2500, it
only moves them.

5000. FS: Universal M-1200 Decoder Card

Newsgroup: rec.radio.scanner
Date: 1996-11-26 00:00:00 UTC
From: Scott and Donna Halligan <halligan@capecod.net>
Message-ID: <329B10D4.18BC@capecod.net>
Source record: 216630
Cross-posted to: rec.radio.shortwave,rec.radio.scanner,alt.radio.scanner,rec.radio.swap

I have for sale a Universal M-1200 Decoder Card. This 8 bit card fits in an ISA slot on your computer's motherboard and decodes the following HF and VHF/UHF digital modes when hooked to your shortwave and/or scanner radio thru a simple audio hookup:

Shortwave reception modes include:
Morse code (CW), Baudot RTTY, ASCII RTTY, SITOR A & B, ARQ-M2, ARQ-M4, ARQ-E, ARQ-E3, FEC-A, ARQ-6-90, PACKET, and WEFAX.

For VHF and UHF, reception of these modes is possible:
ACARS (digital information sent to and from commercial aircraft), POCSAG and GOLAY (pagers), and CTCSS and DCS decoding.

Software and manual are included. This card was purchased about three years ago. I'm simply not using it any longer and I'm hoping someone out there might find some enjoyment from it.

Asking $250.00 or best offer. Card currently retails for $400 new.
Will ship to you UPS COD. Thanks for reading.

I had a DSP-232 for about a week. One of the main problems was a birdie at 145.085-145.105. This is right in the middle of the local packet bbs area. With a cable connected to the 232 my ht picked up this birdie from 35 feet away (s9). The case by itself tx's up th 5 feet away. I checked the unit for proper grounding, and found no problem areas. I tryed to use the unit for 9600 sat work and was only able to get a weak signal from KO-23. I took my 232 back to HRO for an exchange, thinking that I must have gotten a defective unit, but the one the shelf did the same thing. On the way to HRO I talked to two people both returned their DSP-232's for a refund. Knowing the state of AEA, (I called late last week for tech help. The recorded message said the company was being 'bought' and any tech problems or servive warrenty work needed, call ARRL in about a month). I was very lucky to get my money back. I now plan on buying a TAPR DSP93 kit.

Well, , , , the radio traffic continued as it normally does. The
only difference was the apparent lack of trafic for that one test.
Of course, you can't prove a negative, but that's my read on it.
BTW, ground TM is all done with fibre optics, except for missile
to ground signals.

Afternoon,

> Thanks for keeping me honest Jonathan! I don't follow radio-type
> developments and laws in the UK too often, but I thought there
> rules governing manufacture of scanners capable of listening to
> the UK cellular frequencies? Perhaps the laws don't cover the
> manufacturers but only the listener? Wondering if you can set
> me straight here? Thanks!

Certainly no regulations with regard to frequencies (cellular or otherwise).
As a side line the analogue cellular frequecies used here are quite a bit
different from the USA or mobiles are 872.0125 - 904.9875 with the base at
917.0125 - 949.9875Mhz. Channel spacing is 25KHz but as its the band starts
at a 12.Khz offset you generally have to use 12.5 as the step size.

Digital (GSM) cellular is up in the 1800MHz region and all but
"unlistenable".

There are also no restrictions on "owning" a scanner regardless of
frequencies so your OK regardless of its capabilities.

Just don't start to use it !

By law the only things you can legally listen to are:-

AM/FM Broadcast frequencies
Amateur & CB transmissions
When at Sea Marine weather frequencies.

Anything else is illegal. You are more probably likely to win a £20M jackpot
on the UK National Lottery that end up in trouble for using a scanner. On
those occasions where people have been arrested and the use of a scanner
mention in subsiquent reporting the situation was certainly a little more
"criminal" !

For UK Gov't official view on scanner see the Radio Communications Agencies
Web Pages (http://www.open.gov.uk/radiocom/rahome.htm)

> P.S. You guys got any of those MVT-9000s in yet? ;-)

Not generally available yet but been playing around for a week or so with the
ones we have here. No Computer Interface or tagging of each channel is a
dissapointment although performance is very good.

All the best

Damn Gary, chill out. Your starting to sound like Burt Fischer here now. I'd be damned bent if it was my $355. I have been jilted by both UPS and USPS on COD's. There were both cleared up finally but one took almost 4 months before I got my cash. It sucks ! I hate UPS with a passion and the only reason I use them is because I have to. USPS and Fed Ex are way too high priced unless the buyer wants to foot the bill.

Hi,
Does anyone have a listing of frequencies for the malls in NJ. I
am especially interested in Rockaway Townsquare in Rockaway.
Thank for any help

5008. TV/Scanner Antenna

Newsgroup: rec.radio.scanner
Date: 1996-11-26 00:00:00 UTC
From: Mickey Hill <mickeyd@isource.net>
Message-ID: <329AAFF7.313B@isource.net>
Source record: 216638

I have a brand new mid range
TV antenna and rotor. Can any one offer advise on tuning it for better
ala arounnd scanner use. One area I am interested in is the 225 to 400MHz
range. The reast of my scanning fall between the 25 to 1300MHz area. I
know the antenna wont give my optimum performance in all areas, but if
there is anything I can do to improve over all performance before
mounting this setup I would like to do it. One problem is figuring out
which radials to lenghten of shorten. I have several scanners any
receivers that will be attached a one point or another via a spliter(s)
would it be aviseable to install a pre amp at the anntenna its self or in
my radio room? All coax runs will be less than 25 feet, I have purchased
the best coax the ham shops had (50 Ohm). Any input on this or the
feeding of all these radio's would be a graet help. Thanks in advance.

Mickey D.

Anyone have a Tropez cordless phone? Do wou like/dislike it?I'm looking for a two line 900mHz and there aren't too many choices. It seems Tropez was one of the first 900mHz models. Consumer reports reviewed cordless phones in their november issue but they didn't review Tropez. Any guesses why. Who really makes them and where?

Any feedback greatly appreciated.

Thanks
Bruce.

All radio publications are suffering these days, but there is nothing to
suggest that NSR is in dire straits. If there is, I'm not aware of it.
USSN and POPCOMM seem to be quivvering and gasping for air. Some of the ham
magazines went down the tubes. Same for CB radio.

Tough times these days. Maybe NSR is just a little dilatory.....

> Greetings! Can someone post or point me to the frequency ranges for
> the Realistic PRO-34 scanner please? The lable on my scanner is
> unreadable. It was made *before* cellular scanning was illegal.
>
> Thanks in advance.
>
> Taliesin
> The original frequencies for this scanner are 30-54 Mhz 108-136 Mhz
136.005-174 Mhz380-512 Mhz 806-823.9375 Mhz 851.1125-868.9375 Mhz and
896.1125-960 Mhz. In factory condition the Pro-34 will not recieve cell
phone frequencies but they can be enabled by opening the unit and clipping
diode no.11. This mod works on most units but some people say they have
lost low band, mine has this mod. and it works just fine. Good luck. For
instructions check Bill Cheeks books.

5032. Re: Spread Spectrum in POP COM ad

Finally got an answer by calling Steve Crum at Ace Communications. The phone in the ad is a fake phone --"photo composed".

This isn't exactly bate and switch, but it sure is misleading and waste of time to deal with a vendor that can't or won't accurately portray what they are selling.

In message <57fjf8$484@news0-alterdial.uu.net> - kc7iay@ibm.net (Bruce Miller)26 Nov 1996 20:20:56 GMT writes:

Frederick Kelcz (fkelcz@facstaff.wisc.edu) wrote:

: Especially getting up to 800 Mhz, the whip in collapsed position is not
: as sensitive as my dual band 8" long whip from my Yaesu FT530.

So what have you been listening to on 800MHz? ;-)

I wouldn't be surprised if the telescoping whip wasn't the best choice for 800MHz and up, as it'll be too long even fully retracted. But if we exclude North Americans doing illegal things, the average/mean/median frequency for most people's monitoring would be below 400MHz - so the whip is a good versatile choice in that situation.

Myself, I monitor 70MHz - 500MHz all the time. 800MHz is rare (and it's legal here too, although I find it a bit boring so I normally don't bother).

: get real! - I would not want to run around with a stiff rod

Each to his own, I spose. But as far as I'm concerned, its not the size that counts - its how well it performs. (Although I too use a rubber duck when the AR8000 is belt-mounted).

: the AR8000, which, if it hits a wall, car door, etc will either snap itself
: or worse, snap the AR8000 connector.

Obviously, I wouldn't recommend doing the lambada while you have an AR8000 with a 46in whip attached to your jockstrap. Most of the time I use mine at home (sat on a table) or in the car (in a mount).

Daniel.

> --

You would be hard pressed to beat the PRO-2042 with an OS535. Get the right software and you can set up banks of any number channels, groups of banks, CTCSS decode (and DTMF too) and on and on and on. Dump into the program the freqs from an FCC database, mix in freqs from a decent scanner guide and some of your own stuff and you can get the who, what, when, and where of any transmission within your range. Once you have gone this route, there is no turning back.

Comparing this combo to the BC9000 is unfair. The BC9000 isn't in the same league at all. If you want to make the discussion really worthwhile, compare the BC9000 to the PRO-2042, feature for feature.

The way I see it, is that until the BC9000 can provide for computer control, it isn't worth considering as your ONLY base scanner.

Heck, I'll go out on a limb and say, unless your scanner is computer controlled, you're only listening to a radio but you ain't scanning. You got an opposing view, state it: fact for fact. You want flames, forgetaboutit.

: On an AR8000 that I just purchased, I noticed that FM broadcast
: stations can also be received, with lower signal strength, at
: frequencies 12.75 MHz lower. Can anyone tell me if this is normal?

Yes and no. Ideally it shouldn't happen, but its not surprising that it does.

The AR8000 is being overloaded and its image rejection is being swamped. This generally only happens with nearby and very strong transmitters. I've seen it happen before, on lots of different scanners.

There is some debate as to whether the AR8000's image rejection is as good as it should be. The better scanners should be less prone to the problem, but there is never an absolute guarantee. If you are real close to tens or hundreds of kw into an efficient antenna, any receiver will overload.

Daniel.

For about $75 you can get a GRE Super Converter. Check out Grove Electronics
a www.grove.net.

The GRE unit adds 400 MHz to the freq on the display. ex// Tune 457.500 - listen to 857.500

I was recently given a Don Nobles (DN logo) speech inversion descrambler. I think it's from the 70's. It has three wires coming out to hook to the scanner, an on off switch (DPDT one side for 9V and the other side switches signal) and a variable frequency adjust knob. Does anyone know where or how these hooked up or have a schematic for this device or a similar one? I'd feel better knowing before I committed my PRO-2006 for experimentation. I know these were widely used and many circuits appeared for them back then. Any help would be appreciated. I'd prefer a direct email reply if possible, but if not I'll keep a lookout on the Newsgroup. Thanks

My question is probably the same as a lot of people out there.
I am looking to purchase a scanner (Preferably Radio Shack) that
is able to be easily modified to receive the cell phone frequencies.
Or can I purchase a (dual conversion?) scanner and be happy with
the imaging of the frequencies... ?
I spoke with one Radio Shack employee and he said that the newest
models could not be modified, but then I heard a conflicting story
from another employee at a different store...

Since the newer models of scanners may be different as far as how
hard they are to modify, which one do I buy???
I'm looking to spend anywhere from 99 to 299 dollars
Mike

> is able to be easily modified to receive the cell phone frequencies.

Scanners can no longer be manufactured that can easily be modifed
receive cellular. I have seen adds that will convert my scanner (PRO-26)
for
around $100.00. I was told that they use a down converter installed in
scanner. Gone are the days when you could simply clip a diode or a
jumper (unless you can get hold of one made before the law took effect).

> Or can I purchase a (dual conversion?) scanner and be happy with
> the imaging of the frequencies... ?

If you don't mind the problems associated with dual conversion, an 800Mhz
dual conversion scanner will pick up cellular images. Otherwise, if police
or other services in your area use the 800Mhz band, you may pick up
cellular
when you don't want it. Especially when near cell towers. I sold my dual
conversion and bought a triple because of the interference.

> I spoke with one Radio Shack employee and he said that the newest

> from another employee at a different store...

My advise would be to go to Radio Shack knowing what you want so that
you don't have to ask questions. You will probably find that you know more
about what you are buying than they do. Remember, they are salesmen who
would have you believe they technical experts.

When I worked at a local newspaper a few years ago, we were given a confidential list of the descriptions of all the PD's undercover units so that we wouldn't walk in on a bust by mistake, either getting a police officer shot, a suspect shot, or ourselves shot.

Case in point, a pair of undercover police officers were trailing a pair of suspects when the two perps robbed a liqour store. The gun battle that ensued was straight out of the OK Corral, all persons involved were hit, one suspect killed, one police officer wounded critically. Now in your rocket scientist demeanor, you walk right into the bust with your scanner becuase you'd think it was cool to warn the perps or whatever, you're probably going to get a few bullets internally.

Get a life before you ruin it for everyone else.

Sorry to respond to my own post ...

I've found out that:
UP = <ctrl>^ = $1E = 30 = ASCII RS character
DOWN = <ctrl>_ = $1F = 31 = ASCII US character

Has anyone found the algorithm for storing the SRCH memory
information?

Thanks in advance.

Sorry you got some stupid replies, but a birdie is a so called "dead"
frequency. All you hear is a continuous sound on that frequency. This
could be caused by electronics near your radio or it could just be the
radio itself.

Acually, they did make pro-34's that would recieve cell phones. I have
one made before the law changed. In the middle of it's production life,
the law changed and cell was blocked. My original reason for buying
when I did was that cell would be blocked in future pro-34's.

Until someone pulls a gun for some reason, or months of work to bust
prostitutes goes dwon the drain because Ricky Rescue Scannerboy has to
get his jollies off screwing with the cops. You may also blow the covers
of undercover officers who may work in other enforcement details such as
drug bust, etc.

Thanks for the info. But you must forgive me being new to the scanner world.

I see the city Freq. but what is office ###? Is this the CHP site #?

Thanks again,

Michael Rodriguez

this time from home.

Who says her cover is blown?? Its not like this cop is yelling accross
the street to this guy. Unless he is making his scanner audio available
for outside potential "customers" to hear, I cant unserstand how
everybody thinks this guy is going to get this cop killed..

>>
>> THIS PERSON PLANS TO ATTEND MORE UNDERCOVER ENTRAPMENT OPERATIONS,
>>AND ATTEMPT TO KEEP THE COPS WITHIN CERTAIN LIMITS.

Triple conv.

> Please email replies.
>
> Thanks
>
> Tim

I have both the PRO-26 and the AR8000. As far as ease of use,
the PRO-26 wins hands down. It also seems to have better reception
than the AR8000 (For anyone else reading this, I have tried antennas other
than the stock one that came with the 8000) and scans faster.

The advantages with the AR8000 are the computer interface, expanded
range, and increased channel capacity. It has some neat tricks, but I
don't
consider those useful for pratical scanning. I have yet to decide which
will
be my primary mobile scanner.

As to your question, I believe that the PRO-26 is a fine scanner that
desires
your consideration. From what I've heard, you might want to also consider
the
Uniden BC3000.

I have one of the original Tropez phones &
i have to say that its the best phone i've ever had... It sounds
clear, feels nice & has excellent range. Tropez phones are made by
Vtech... I believe their homepage is www.vtech.com . the newer ones
have had a design facelift and they've
extended the talk time to 6.5 hours & standby to 5 days. The two line
model has an LCD to show you the number you're dialing. Their main
competitor of the two line model is the Uniden EXP9200, which costs
299$. The Uniden lacks the LCD but sports a fully lighted keypad, 9.5
hours of talk time, a spare battery charger & a speakerphone which the
2line model of the Vtech lacks. The EXP9200's transmission system is
not only 900MHz digital, like the tropez but it is spread spectrum so
that static on your end is pretty much eliminated...the EXP9200 also
has a 3 way phone call feature
which allows you to dial both lines and talk to everyone
simultaneously.
hope that helps you decide

-Daniel

Main high channel (although they use the Secondary in Wake County more
often than this one).

>154.68 PAC-RT secondary

this is the one they use when you hear them say "go to the high
channel" (at least in the RDU area of NC) - it is also used during
the state fair in October by the many troopers directing traffic and
so on.

>155.19 base-to-base
>155.475 NLEEC [every police department in the universe licenses this one
>whether or not it is used]

yup - good old mutual aid. There is another one in NC too....this way
all the police groups have a common channel in the event of some
cataclysmic event or something I guess...

>I have heard what sounds like a translator or repeater coming out
>on, I think, 42.84, not real strong but I figured they must have
>an extensive radio system to cover the whole state. Do they dispatch
>most everything out of Raleigh? I would have figured that they
>divided it up into regions the way Virginia does.

nope - they have troops A - H and then the state is divided up into
Dispatch Boundaries. The confusing part is that the Frequency
boundaries (geographic locations that define the Base Frequency) do
not follow the Dispatch Boundaries always (although they are divided
up by county - depends on your county as to the base frequency and the
troop dispatch area).
>
>Although I wasn't using the best antenna on my car when I drove through

?

well - the base to car is nice and loud - getting the car to base
response is another matter entirely. And you are right - they don't

chit chat too much.

Probably none, you'd need to find a tube type set that could cover
roughly 800 - 900 Mhz and you'd need a sack full O' crystals as the
cell sites move around quite often from one cell (frequency) to
another.

Kenwood TK 805 D Commercial grade UHF mobile rig, 16 Channel with SCAN capabilities. Will cover the 440 Amateur band up through 480 Mhz with NO PROBLEM. This radio is TOTALLY field programmable, no software or other equipment necessary to program in the field on the fly. Nice compact size, with Super audio, user defineable PL and DPL tones. MINT condition, in box with manual, and all accessories.

I have TWO (2) of these available...

$250.00 shipped to 48 states, will consider package deal on both...

Will accept pre-payment by U.S. POSTAL MONEY ORDER, OR will ship COD paid by U.S. POSTAL MONEY ORDER.

NO TRADES!

Contact vie E-Mail if interested.

Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.swap

For those of you who have been following this thread, and continue to be interested in how the "Tightest ship in the shipping industry" stays afloat...then read on.....

As of my last post I relayed that the person to whom I sold the item paid the UPS driver with a US Postal Service Money Order made out to ME!

Apparently, somehow, the mighty UPS is able to cash this, deposit the money, and then issue a check from there. This is something none of us can do without committing a federal offense.

This also blows a big hole in the position of some here that having your COD customer pay the COD with a US Postal Money Order will ensure faster service, and eliminate them having to cut a check. Not so.

Although some here complain about my rantings on this matter, my posts apparently got the attention of someone at Customer Relations in Atlanta, who E-Mailed me, provided a phone number, and was apologetic on the phone, promising swift action. This was on Friday of last week, and he promised someone would call me first thing Monday morning. No one called.

I find it amazing that after NUMEROUS calls and complaints to the 1-800 number, NO ONE from UPS EVER contacted me. It took the power of the Internet to get their attention. AMAZING!

I called him yesterday afternoon, and only then did he have someone from the UPS facility in New Jersey, Customer Relations, call me. Of course, this person had no answers, said the COD department was closed, but promised to call me today with information. He did not call.

Again, at around 4 PM today, I called him, and he said he would walk over to the COD department to check things out. (You would think he'd have done this already, having promised me action YESTERDAY!)

He called back and said that the records show a UPS COD check was cut and sent on 11/14, and apparently was lost. (Something I already knew, and deduced) They would put a stop on that one, and issue a new one. What with the holiday, Thursday, you know, this may not happen until Monday of next week! So he says.

Hopefully, next week I'll have my money.

So, I offer the above as information, education, warning...take it as you wish, into the workings of the "tighest ship in the shipping industry" A ship with apparently many holes in it's hull.

The saga continues...stay tuned.

From: craig@yonder.southern.co.nz
Message-ID: <849072940.22snx@yonder.southern.co.nz>
Source record: 216544

I tried out this program yesterday... and gave up on it almost
immediatly. It has a frequency limit of 999.99999. Most decent
scanners go up higher than one thousand MHz.

Craig.

If this is true, then I am going to have a talk with the US Post Office.
A money order is made out to a specific person, it is not made out to
"John Doe - unless it is for payment of a UPS shipper's COD fee".

If this is indeed allowed, then it is time to start contacting our
congresscritters, and raising hell.

From: Norvin Adams III <nadams@wincoinet.com>
Message-ID: <01bbdc60$f235bdc0$ab4582d0@NorvinAdamsIII>
Source record: 216553

The PRO-2035 is a piece of junk (BELIEVE me, I use to own one). If you bought it, you would more than likely want to use its auto program feature to find aircraft frequencies. Well, the auto program feature is the problem. It will program the same frequency as many times as it wants to which is hundreds.

The PRO-2006 is considered by many to be the best scanner ever made because the cellular frequencies can be restored. The only problems I know of is that it only has 400 channels, and it may also have the same auto program problem as the PRO-2035.

I now own the PRO-2042. I think this is the GREATEST and BEST scanner made! It is the same thing as a PRO-2035 except it auto programs perfectly, will tell you if you are programming the same frequency more than once, gets rid of the green spinach light with beautiful orange (I LOVE that), and all other problems. It has 1000 channels which is enough. I only wish it had a way of counting how many times a frequncy has been used and cellular reception.

I bought mine on sale with a 10% discount for $350. It now sells for $500, but it should be on sale very shortly. I would STRONGLY recommend the PRO-2042. It will fit you like a glove.

had one here in the lab for a week - it's WELL deaf -

best sig = -116/12 average -114/12 worst -43/12

(sorry ! in case thats "wibble" to you, i'm referring to microvolt/12db
Sig:noise ratio as a sensitivity measurement. the more negative the
figure, the more sensitive the radio)

but it has to be a bit deaf really as it's inside a pc case (I suppose)
worst -43/12 at 500knz

my moneys on my aor 8000 (-123/12) closely followed by the yupiteru
range (-117 to -119/12)

that aor 3000 is the one to beat ! worst -118 best -125 SUPERB !

just like the casio qv-10 digital camera ! NICE TOY - BUT JUST NOT GOOD
ENOUGH AT WHAT IT'S SUPPOSED TO DO !

REG'S

R!

5113. Just bought a scanner and .....HELP!!!

Hi,

I bought a scanner today from the clearance rack at Wal-Mart. I've been wanting one for awhile, just never got around to buying one. It's a Bearcat BC178XLT. At $48.00 it seems like a good buy. Now I've found out city and state police use 856. to 860. MHz. Can this scanner be modified or would I be better off returning it and buying one with the 800 MHz.

Also does this NG have a FAQ ?

Any info. is greatly appreciated.

Thanks,

Bill

Source record: 216558

I have the 890 and 9000 xlt. The xlt (triple conversio) is superior
but I use the 890's auto search/store feature to get around the image
problems. I let the 890 find new freqs and lockout the images, etc
when I review what it found. It's a good value for the $$.

Andy

I posted a similar request a while back.

A great idea it seems to be.

No one responded who is using it a SW DXing radio.

It is more often used for scanning higher frequencies such as police,
air and fire, etc.

A new, improved version will be out soon.

It does not appear to be a good value for the $700, but might fill a
niche for the handicapped or complete computer geeks (like me).

The past few days I've had luck hearing both Russian and American astronauts on board MIR (but not from the Shuttle); try 145.85 (US amateur) or 143.625 (RS MIR). If you can, leave a tape recorder hooked up on VOX and scan those freq's; in both cases the transmissions, while clear, have lasted less than 2 minutes each.

Good luck!

Heh, this is a common problem, and not just with the DSP-232.
The PK-232 has it too. The problem is a lack of RF bond between
the case halves. If you sand the paint off the mating surfaces,
and use a screw every 5 cm (as is standard VHF shielding practice),
those harmonics of the reference oscillator stay inside where
they belong, and don't radiate all over the shack.

> markt@bangate.compaq.com

Actually I guess the image is 12.8 MHz lower (hard to pinpoint exactly
in WFM mode), which I understand is an internally-generated frequency.
There are definitely birdies at 12.8, 25.6, 38.4, etc.

From the FAQ, "Buying a Used Scanner:"

PRO-26: 1995 vintage. (Not to be confused with a simple 1985 |
crystal controlled portable bearing the same model number.)
Very good portable made by for Radio Shack by Uniden. 200
channels, very fast scan/search. Good display. Covers all
TV channels, but spectrum adjacent to cellular phone band is
censored which prevents monitoring parts of some trunked
systems (e.g., IL State Police district 4). Up to 50
frequencies can be skipped during search. Limited image
rejection causes 929 MHz paging interference in 170 MHz
range. IFs are 380.7/254.4, 58.075, and 5.5/0.455 MHz.
Audio suffers from small speaker. See "The Radio Shack
PRO-26 vs. Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S,
in Monitoring Times, August 1995.

BC3000XLT (Uniden): 1995 vintage. Excellent 400 channel
portable with 20 banks. Up conversion. Very fast scan,
search, and intelligent Auto Store. Mode, attenuator, and
delay settings programmable for each channel. 50
frequencies can be locked out during search. Larger speaker
than PRO-26 produces better, crisper audio. See "The Uniden
Bearcat BC3000XLT," by Bob Parnass, AJ9S, in Monitoring
Times, April 1995 and "The Radio Shack PRO-26 vs.
Uniden/Bearcat BC3000XLT," by Bob Parnass, AJ9S, in
Monitoring Times, August 1995.

Source record: 216368

I got my serial interface working and I tested it with Radio Manager. Now I want to make some changes to the EEPROM contents. If anyone has done this, I would sure appreciate some pointers.

I tried playing with Microsoft Terminal and Crosstalk to just see if they will work. When I type a character, the scanner knows that it is recieving something (serial displayed on LCD, but the scanner doesn't seem to respond by doing anything. Im using the commands from WJE's 2700 page. Are there prefex/suffix characters that I need to use? Or maybe CR/LF?

Then I tried to have the scanner output it's brains using a copy-send from the keyboard. The terminal programs would show a few characters, but then it appears that the scanner stops sending. Could it be waiting for some sort of acknowledgement?

Thanks in advance for any help.

Jim

5125. Scanner Audio Online

Newsgroup: rec.radio.scanner

From: dstark@frontiernet.net
Message-ID: <57kfi2$18ei@node2.frontiernet.net>
Source record: 216369

I am running periodic tests with Internet Phone version 4.0 to put audio from my scanner onto the Internet. So far, a few individuals have visited my unannounced tests and apparently the system works.

If you have Vocaltec's Internet Phone and log into their Global Online Directory, look and see if anyone is in the Scanner Audio Test chat room. If you see me (NF2G) in there, I am running an audio feed from my scanner. You won't be able to chat with me at all, but you can listen to whatever is coming over the scanner at the time.

These tests are periodic and take place whenever I don't need my phone line for anything else. Yesterday I ran it for about 8 hours. I am configured for up to 4 simultaneous connections. If that works well I can boost the number.

Write to dstark@frontiernet.net with any comments about the test, especially if you encounter problems with the audio.

I also have some RealAudio recordings of major incidents that took place around 1982 or 1983 in upstate New York available on my website. Check out -

We modify Scanners,Ham Radios & Commercial Gear.
Quick turnaround time.
For more info & a price send Email with the Model & Mod you are
interested in ,you'll recieve a response.
Most Scanner Mods run about $15-25.
Others will vary depending on complexity.

Some of the Radio Services Offered:

Open Full 800mhz.
Increase Scan Speed.
Add Channels/Memory.
"Bug" fixes
Expand TX & RX range.
Reprogram Commercial gear (Motorola,GE,Yaseu,Kenwood,Standard).
Minor Repairs & Tune Ups
Physical Enhancements (i.e, add a Speaker/Headphone out jack,change
Antenna connector type, add LED's,etc...)

Greetings,

I am still looking to buy or build a Kenwood IF-10D interface for my TS-60s all-mode transceiver. This interface mounts inside the radio and serves as a buffer between the radios digital board and a level converter such as Kenwood's IF-232C interface. I am building my own level converter from readily available plans, but I have not been able to find any plans or specifications on the IF-10D.

If you have information on this interface, or have an IF-10D you would like to part with, please leave me a private Email message and I will get back to you.

All reply's will be answered.

Thanks for your time.

Mike, N2QAC.

>Thanks for the info. But you must forgive me being new to the scanner world.

>I see the city Freq. but what is office ###? Is this the CHP site #?

>Thanks again,

>Michael Rodriguez

>this time from home.

Hi Mike,

Each CHP Division has specific office or station numbers like 87 so
you know you will be listening to San Diego followed by the officers
number say 43. The Dispatcher will say something like 87-43 go to call
box 134 on the 5 freeway.

You have noticed the Oceanside and San Onofre and Temecula all use
the same frequencies, so to distinguish between them you will hear the
dispatcher say 92-123, 115-78, 132-12, meaning officer 123 from
Oceanside, officer 78 from Temecula, officer 12 from San Onofre.
It also tells which part of the Freeway system the officers patrol.

Hope this helps you some more in your new interest of scanning.

Mike

5133. How do I pull a state's freq.s out of Percon using Access?

>Anyone know why Icom V/UHF receivers have such slow scan rates (10-20 channels
> per second, when everyone else approaches 50) and are there any mods
>available to substantially increase that rate?

For the most part the scan rate of a synthesized scanner depends on
the design of the PLL oscillator circuit. Without seeing a schematic
I am assuming the Icom receivers do not employ a fast-lock type PLL

In general terms here's what that means: the loop filter will have
two (or more) switchable bandwidths which first, in wideband (corse)
mode allows the VCO to tune quickly, then in narrowband (fine) mode
allows the VCO to tune precisely to frequency. In another variation
on the theme the corse steps or ranges are under microprocessor
control and the PLL does the rest.

What to do? Well it would probably require a complete synthesizer
re-design to get that kind of speed and Icom does call their receivers
"communications receivers" and not "scanners." What comes to mind
right away would be to use a fast-lock synthesizer in a basic "signal
detection" receiver which would then tune the Icom via the data port.
Wouldn't it be easier to just get a fast scanner?

Andrew

Well Chris

Best thing to do is get the book....call Scanners Unlimited
and ask for Glen and ask Glen to help you with info he may
have for sale....this way you get the most current list or
booklet available. Glen is in San Carlos on Laurel Avenue
across from the Yogurt Shop on Main Street.....it is a 415
prefix. Call information and enjoy.

He is closed on Sun/Mon.

I am looking at myh copy of Govt. Radio Systems, but it is
a bit dated...1994. Freq's may change and best to get the
updated filess.

This is from Mobile Radio Resources in San Jose
408 269 5814
There is a section in the book for sports...and it's
on disk for those who enjoy ...

>- TAIT 3010 UHF
Chuckle.....

What you have is basically a application difference between the Visar,
and the GP300. The Visar because of it's size can be used in a number
of situations where the added bulk of the GP300 would not be usefull.

Cost, becomes a factor, as the GP300 is MUCH cheaper than a Visar.

5154. [WANT] Comments on Uniden BCT-10

Newsgroup: rec.radio.scanner
Date: 1996-11-28 00:00:00 UTC
From: scotte@shore.net
Message-ID: <57lmo8$sde@northshore.shore.net>
Source record: 216398

I am preparing to purchase the BCT-10 for use in Massachusetts.

I really like the idea of preprogrammed state police frequencies (does it also support 800 Mhz for trucked radios)?. I also like the ability to spot a police car even if their radar isn't on.

How well does it perform overall in Massachusetts?

Any comments, though, anyone has would be greatly appreciated.

Hi!

I have a AC to DC adapter just sitting around collecting dust. Make an offer!

Input:

120V 60Hz 40W

Output:

12VDC 1.5A

Anyone interested? Best price by e-mail gets it!

Thanks!

Andrew

5157. Re: Any opinions on RS Pro26?

Source record: 216401

I agree with David in that the Pro-26 is a fine scanner; which is should
be for the top of the line. I have too friends who recently came to me with
recommendations for a scanner. After talking to them and giving them a
hands-on demo of a Pro-26 and BC3000, one chose the 26(for size and battery
flexibitity) while the other chose the 3000(for the rechargable Ni-Cad).
Each bought the scanner mail order and each paid $349 total. You can't
go wrong with either of these scanners for the price and features.

Strong signals,
Rich

Radio Shacks web page has directions for the pro-43.
These are very close to the 2006, in fact most of their scanners are
controlled with the same key strokes.

>product range

No, the SP10 is the low end of the Motorola Product range. The GP is
on the low end of the BRANDED products, but the SP10, SP50, P110, are
all cheaper. The SP50 and P110 are very viable alternatives.

>Taliesin

The label on the PRO-34 9MODEL NO: 20-135) lists frequencies covered
as:

30.-54., 108.-136., 136.005-174., 380.-512., 806.-823.9375,
851.1125-868.9375, 896.1125-960MHz

I don't know if this covers all of the cellular channels, but I know
that I can listen to some, but sometimes only one sided.

Dave

I made a error. the GP300 is not a branded product. It is however,
still nowhere near the low end product either.

>Can anyone tell me the differences between the Motorola gp300 and the
>Motorola p110?
Not a whole lot. GP300 will do DTMF PTT ID, p110 will not.
GP300 has internal vox, P110 does not.
GP300 available in 2 or 16 channel new,
p110 2, 6 OR 8 Channel.
GP300 multiple scan lists, P110 only 1 scan list.

There are most likely a few other minor differences....

Any information will be helpful. Thanks......

5169. BC80XLT Impressions

Newsgroup: rec.radio.scanner
Date: 1996-11-28 00:00:00 UTC
From: wellsr@ibm.net
Message-ID: <57janj$1av2$1@news-s01.ny.us.ibm.net>
Source record: 216480

Having recently learned that Uniden has discontinued the BC80XLT,
its features and price seemed attractive so I decided I'd pick one
up. What follows are my personal impressions regarding the features
of this scanner. This, in no way, should be viewed as an endorsement
to purchase this radio. I have no personal or business relations
with Uniden Corporation. This is simply thoughts offered to my
fellow hobbyists who may be interested in this scanner for whatever
particular reason.

What you get : BC80XLT, antenna, belt-clip, AC charger & earphone.

Basic specs :
Channels : 50
Banks : 5
Bands : 11
Coverage : 29-54, 137-174, 406-512, 806-956(minus cellular)
Scan : 10 - 20 channels/second
Search : 10 - 20 freqs/second
Delay : 2 second non-programmable
Priority : 1 programmable channel per bank
Lockout : Per channel
Lock : Keypad
Weather : Keypad
Light : Display only

Construction and Physcial
The case is molded of sturdy, dark gray plastic like most
scanners these days. Its size places it right between the new
BC3000 and the older BC220/230 models. It is on the large size
if ease of concealment is an issue.
With batteries installed, it weighs in around one pound and
has a nice "heft" to it. It feels well made and should prove
to be quite sturdy and provide years of trouble feel use.
The top panel consists of the antenna BNC connector, earphone
jack and on/off/volume and squelch controls. The front panel has
the display on top, with the keypad underneath that with the
speaker near the botton. The bottom rear portion houses the
battery compartment which has a cover listing the frequency ranges
of the 11 bands.
On the left side, is the typical power jack used to provide
external power via an AC or DC adaptor.
The keypad is composed of large, well-spaced keys layed out
efficiently.

General usage
The display is similar to the 220 but has larger alpha-numeric characters. It is nicely lit by two green LEDs located along the left and right edges like the BC3000.
The user's manual lists the audio output as 18mW?! I think that should be 180mW like most of the other Uniden scanners. The quality is not quite as crisp as the BC3000(probably owing to its smaller size) and the mid-range is lacking compared to the BC220.
Unlike most Uniden scanners, this model is powered by 4 AA batteries instead of the usual Ni-Cad. The battery compartment is accessed via a clamshell panel(similar to the Pro-51) located along the bottom rear of the case. Inside the compartment is a switch used to control charging of the batteries. If Ni-Cads are installed, the switch can be set to "Ni-Cd" so that external power applied to the scanner can be used to charge the Ni-Cads installed. This leads to the obvious situation where normal alkalines are inserted but the switch is left in the "Ni-Cd" position which would result in external power trying to charge the alkalines! Consider yourself warned and always double check the switch setting when installing batteries.
When the battery voltage falls below a preset level, there is both a visual and audible indicator. I also run into an interesting condition when I open the battery cover. In most cases, when I replace the cover(regardless of whether or not I have changed batteries), when turned on, the scanner proceeds to scan all five banks. Memory contents, luckily, are not effected. It also appears that this radio has no automatic battery saver option.
The earphone jack provides decent monaural audio to both sides of a pair of headphones. However, during scanning, an annoying clicking sound is heard if headphones are used. This sound is not heard when using the earphone or when using the search feature.
Speaking of search, only a band search is provided for. You get to select one of the 11 bands of coverage to search in; there are no programmable limits to search between. This would not be so bad if it weren't for the slow search speed. However, the direction of search can be reveresed and the search can be put on hold and then the arrow keys can be used to move up and down one step at a time.
Searching the entire range of all 11 bands turned up only nine birdies!
The priority feature allows one channel within each bank to be tagged as a priority channel. Once scanning is started, the PRI button is pressed to enable priority sampling every two seconds. I would rate its "intrusiveness" as middle of the line(how much conversation is missed on an active channel while the priority channels are sampled for activity).

RF performance
For a scanner in this price range, it covers a wide section of the RF spectrum. The glaring exception is the VHF air band

(108-136.995MHz).
To test its sensitivity and intermod rejection, I compared
it to a BC3000, BC220 and Pro-26. The 80 was definitely more
sensitive in the VHF lo band than the 3000. It was on par with
the 220 and 26.
The 150-160MHz range revealed its double conversion nature and
was practically identical to the 220 for intermod.
The 450/460 range again revealed intermod and sensitivity
slightly less than the 220.
It was a fine performer in the 800MHz range. It was less
sensitive than the 3000 and on par with the 220. MANY signals
were received by setting the squelch appropriately and then
removing the antenna! However, if you are a heavy 800MHz
trunking junkie, you will probably not like this scanner due
to its forced two second delay after each transmission.

Overall
This scanner should definitely be considered in the "beginner"
category due to its low feature count, scan/search speed and
number of channels.
In its favor are a nice display, good audio, good RF coverage
and sensitivity and battery flexibility.
Its weaknesses are channels, scan/search speed, lack of VHF
air coverage, non-programmable search and double conversion receiver.
If you are just starting out, this scanner would definitely do
right by you. Especially considering the mark-down in price you
should be able to find since this model has been discontinued.
If you can't find any BC80s left, then you should look at the
Radio Shack Pro-66 which is practically identical but retails for
$179. The Pro-66 does give you programmable channel delay and 20
search skip frequencies but I believe you give up the display
back light.

Strong signals,
Rich

This is not Eugene...nor is Eugene like Portland where the problems with the whores are more evident. Nor is it Honolulu where the whores and like have taken over Waikiki and beyond.

This is referring to Calif...cops stop and question people who talk to whores for a period of time and take down their car license plate numbers and more. Then when they see you again after they run your plate, they stop you and inquire and try to get your attention to stay away.

If you don't carry ID they can arrest you...that and the prosti/whore area makes it very easy to do. The cops are cops....that is what they do.

They can take your car if they arrest you....but a lawyer can get that back...but most don't know this. Depends on circumstances.

Again, don't assume the mores of Eugene are transferrable to San Fran or Hono or Seattle or else .... you have to get out and travel more cities or live in more...then you learn.

Source record: 216487

Has anyone ever experienced the loss of frequencies on their scanner ?
Upon turning mine on last week (new batteries) every pre programmed
freq was erased. I reprogrammed all the freqs and two days later the
same thing happened any suggestions would be appreciated .

It's in the current flyer I just received (pg. 40), on sale for $189.99.
While it could be that rumors of this model's demise are greatly
exaggerated, it's also possible that they're just liquidating their
remaining stock before dropping it.

Regards,
Mike

Does anyone else smell that smell. Very interesting smell. Wonder what it is? I know! It must be bullshit.

This poor bastard can't even spell scanner. What the hell is a SACNNER?

This story has about the same chance of being true as a one-legged man has of winning an ass kicking contest.

From: trekker1@pipeline.com
Message-ID: <57jp3e$tql@camel4.mindspring.com>
Source record: 216491

Hello! I would like to request that the frequencies for all of
the sports venues in the San Francisco Bay Area be emailed to me. I am
referring to these locations:

1)Oakland-Alameda County Coliseum Complex
2)Candlestick/3Com Park
3)San Jose Arena
4)The Cow Palace
I would like to have the frequencies for security and the food
services at these venues. I know that Volume Services has the food
contract for the Oakland Coliseum and Candlestick.

If anyone knows of any sports venues that I may have forgotten,
please send me those frequencies as well.

Thanks!!
Chris Halladay
Castro Valley,CA

Greetings,

I am planning on building and buying the hardware to interface my Kenwood TS-60s to my computer. I am sure their are others who have already done this and have some opinion on the software available to control the radio once the interfacing has been done. I would like to hear from people who use their radios in this manner and get their feedback on what software they use and what they like or do not like about it. Any recomendations would be appreciated.

Thanks for your time and all reply's will be answered.

Mike, N2QAC.

I own a Uniden BC 200 xlt for 4 1/2 years now with no problems. It is
a good solid unit . The only drawback is, it doesn't cover military
air freqs. But if you only are interested at this time in the CHP it
will serve you well.

CHP

Oceanside 42.42 42.84 office 92
39.80 42.84

San Diego 42.88 42.66 office 87
39.40 42.66

San Onofre 42.42 42.84 office 132
39.80 42.84

Temecula 42.42 42.84 office 115
39.80 42.84

CHP UHF Radio System 460.3750 VERY IMPORTANT FREQ=
Multi-agency law enforcement. (old California State Police Freq)

Good scanning makes good friends,

Mike

> Yes, he who lacks a mind-stem. I have press credentials to go
with my claims.

Nice thing about being PRESS....we show our credentials and the
cops leave us alone as long as we "be good"....meaning we find
a spot where what we do is not seen....so the cops will not have
to worry about us interfering with their game.

Have been doing it for 18 years...photojournalist. Both still
and video. My stuff has appeared on major TV feature shows and
all nets and more....major portfolio of printed news shots in a
few large metro papers plus two stories done about me and my
photo and video pursuits....

plus more.....

dren1000@aol.com wrote:
: Does anyone have any comments , good or bad about the 855xlt ?
: Any information will be helpful. Thanks......

Mine has lasted several years now. I have an older model, which I
modified for 100 channels. (don't think the special mods for the new
models have a memory enhancement mod)
The BC860 is one jump up. I _think_ it has 100 channel capacity as
well as a data squelch which supposedly will cancel out data
transmissions (although, reportedly, unfortunately, will not cancel out
the control channel of an 800 MHz trunked system)
The scanner has a problem of intermod with cellular phones and
pagers. This is typical of 800 MHz scanners with double-conversion
circuits. It is an okay scanner for the money. I'd get the 860
though... I would have if it was out when I went to buy a scanner.

Newsgroup: rec.radio.scanner
Date: 1996-11-28 00:00:00 UTC
From: nyo41ed@aol.com
Message-ID: <19961128052100.AAA13673@ladder01.news.aol.com>
Source record: 216500

Dear Scanner Friends:

I would like to introduce you to the one of the oldest, nationwide, bi-monthly, all-scanner clubs called, THE All Ohio SCANNER CLUB.

Read the 40-60 pages each issue with columns written by editors from the former NORTHEAST SCANNING NEWS, along with writers from many other radio publications such as Monitoring Times, Popular Communications,US Scanner News, etc . AOSC also has some of the leading authors of various communications books on staff. Such books as FIRECALL, MONITORING THE FEDS, several SCANNER MASTER titles, and many more.

Were not just for OHIO anymore, we now have great coverage of the entire NORTH-EAST corridor and a NATIONWIDE column as well!

We specialize in CTCSS (PL) tones and print a great many of them in each issue. With unbiased, tell it like it is, Book and Product Reviews. Past issues contained "how to" articles on home-brew antennas.

We have reviewed books like the "SPECTRUM GUIDE", "POLICE CALL Plus", "RAILROAD RADIO", "FREQUENCY ASSIGNMENT MASTER FILE", "PHILADELPHIA AREA FREQUENCY GUIDE", "METRO CONCEPTS SCANNER PLANNER" and others.

Read our review of the March 1996 Winter SWL Fest in Kulpsville, PA or the September Hamfest in Virginia Beach. We even attended the September Air Show at the Oceana Naval Air Station in Virginia.

Learn all the "SNOOPER FREQUENCIES" (many that are either new or that you probably never knew about), that are banned by various new and old laws.

Laugh at the funny Top-Ten lists each month. There are no one-liners here!

Read the various feature columns each issue including: Beginner's Corner, U. S. Military, Federal Government, Aviation, Surveillance,Scanning Across America, Scanning Cyberspace, Transportation, Scanning Nostalgia, Tips & Tricks, CTCSS Corner, Utilities/Business, ANARC News, Buy/Sell/Swap and many others.

Sammy The Scanner isn't on our back cover.

Most states have at least one column they fall under, many states have more than one.

YOUR "ONE STOP" SCANNER SOURCE OF INFORMATION FOR THE U. S.

AOSC is a member in good standing of ANARC (The Association of North American Radio Clubs.

For more details:

1. See our homepage at: http://aosc.rpmdp.com/

2. E-mail Dave (at : n8oay@bright.net) with your name and mailing address and he will send you one of our Introductory Flyers telling you all about THE ALL OHIO SCANNER CLUB.

3. Post your name and address right here.

4. Or, write to Dave at THE ALL OHIO SCANNER CLUB, 20 Philip Drive, New Carlisle, OH 45344-9108.

REMEMBER: AOSC is not just for Ohio anymore!!!!!!!!!!!!!!!

HAPPY MONITORING!
Ed (just a guy who subscribes, I am not a board member of this not-for-profit club, nor do I stand to make any financial gain from this posting.... it is purely informational)

Hi, I've read that you can modify the pro 2026 for cell, but you can't if it is the similar model 2026 "B". Well, I just bought a 2026, but the package says 2026 "A". Apparently radio shack added a memory feature and a stand to it. My question is, can this one be modified for cell operation like the regular 2026?

Thanks for any info...

Rich,

This isn't meant as a flame, or to question your abilities. <G>

Why would a beginner buy the BC-80 or a Pro-66 when a Sportcat can be had for $10 more than the 80, and
$20 less than the Pro-66 on sale?

I ask this because a girl at work wants to buy her fiance one for Christmas, she asked me for input,
and the Sportcat looked like the best value in the price range. I don't own a scanner at this level,
I have a BC200-xlt, Pro-2006, and Pro-2035.

Nice review of the 80, thanks.

Barry

Nashville TN, 1991. just north of the central district border, in
East secter, Dickerson Road, just north of Douglas avenue.

Idiot had been listening to the stings for prostitution, and decided
to go warn people. Had a handmade sign on the back of his
pinto (Gag) warning people of the sting.

When arrested, he said he had first heard about the stings on his
scanner, he had one in his car tuned to east patrol.

Check it out. Call east patrol sector.

they will also tell you about giving out a address to go and serve a
warrant, and finding the person later, who had been warned by phone
calls from strangers that the PD was enroute to the house.

Don't think for a minute that it does not happen.

I just obtained a set from Toys R US and found that they're using
916.875 Mhz for the main calling freuquency. The units seem to
switch to another freuquency only if you two party lines active at
the same time.

If you place the phones in Private mode, they switch frequencies once
a link has been established between two phones.

The phones do not appear to be using DCS or CTCSS.

I've also noticed that if a link goes inactive (you haven't keyed the
link switch for over 15 seconds) the units get lost, and unless both
parties hit the clear switch, there doesn't appear to be away for the
two parties to establish another connection.

there's lots of juicy stuff on the cellular bands (869-896mhz) I have
heard the normal honey I'll be home late, contractors ordering suplies,
realators arranging to show houses, people talking about an employee they
intend to hire, promote, or fire, I was about a block away and heard a
girl give a guy directions to her house. have also heard people make
Airline reservations or a credit card purchase using a cell phone...
That's something I caution anyhone I know with any type of radio
phone (cordless or cellular) to NEVER do!
You justhave to be listening at the right time...best time is during hte
morning or evening rush hour....
have also heard drug deals and plotting of other illegal activity...
yes, on the police frequencies yhou can hear interesting phone patches
too..officers calling their wives, the chief calling dispatch..probation
officers calling people they are supervising....asnd the list goes on...
if it's out there, my radios will find it!

I would try the following frequencies:

49.830
49.845
49.860
49.875
49.890

If that doesn't work, then you may want to search from 902-928 Mhz

5217. McDonalds "3M (GM)" Headset Freq?

Newsgroup: rec.radio.scanner
Date: 1996-11-29 00:00:00 UTC
From: Bryan Crider <criderb@ttc.com>
Message-ID: <57nma6$eb@relay.ttc.com>
Source record: 216278

Does anyone know the frequencies of the new "3M" headsets
that McDonalds is using? They're grey one piece units
that are mark with a "GM" logo, but the base unit near
the Drive-up windows is marked "3M". I search the entire
UHF band (457.xxxx, 460.8875 - 469.9875) and was unable to
get any hits. I also tried the old VHF-low/VHF-hi combos
(35.02/154.600) and 154.600/170.245), but was uanble to
get a hit on those also.

To scan over digital you need to get a radio such as the Motorola
Astro-Saber (portable) that is digital, it picked up the full bandwith, I
am familiar with this radio in the 400mhz range scanning in NYC where som
agencies are starting to go digital.

You can also use the Astro-Spectra which is the mobile/desk unit version
of the Astro-Saber.

It is not inexpensive to do this though.

You can also use an "open modem" with a modified cord to scan over and and
recive the MDT systems (KDT, Laptop Dispatch...etc..) used by many
agencies as well.

Here in the Phoenix area, the cities of Tempe, Scottsdale, Glendale, and Chandler use 800mhz systems....
there is usually a method to the madness....TEMPE uses 860.7375-->856.7375 and also 856.4875-->860.4875....usually "Channel A" will be on a discrete frequency..normally 860.7375 or 859.7375..
ther are some systems though, like the GE/ERICSSON system used by Sky harbor Airport where each reply to a conversation may shift to a different frequency..this is either preceded by a control tone or data burst.
in this case, I scan the frequencies from Hi to low..not hard to follow a conversation using this strategy!

hope this helps JOHN

Hi there,
Make sure your not having the infamous BC200 battery indicator problem. I had this problem. I would charge it and about 15min later the battery light would come on. Check the usual mod web pages for a fix. If that doesn't work, the batteries are simply 4 AA NiCd's. Anyway, the batteries are all shrinkwrapped together and a they bridged them with a pice of metal and solder patches. Take the pack apart and you'll see what I mean.

5221. "Sound Feeder"

Newsgroup: rec.radio.scanner

In the latest issue of Popular Communications there is a product called
"Sound Feeder" SF-100. This device transmits an audio output from an device
like a CD player or scanner to you FM stereo receiver.

Anyone have any experience with this product.

Thanks

Brian

A lot of these use 88-108 MHz so people can plug their FM Walkmans and
listen.

Check http://www.orst.edu/~varineb/ffood.htm or
http://www.orst.edu/~varineb/fastfood.htm

I think I stuck Bob Eisners master list in there. He is the guru of
headset freqs. I know they are up in the 915MHz area using WFM.

Does anyone know what frequencies "Toys R Us" is using for
the headsets that some of their employees are using? I was
shopping there the other day and noticed an employee wearing
a headset that looked like the ones that are used by McDonalds.

They appeared to be Pansonic headsets.

Bryan

Hi Curtis,

this might also be one of the new V-Link phones that Toys R US is selling for Christmas this year. A guy that I share an office with just obtained two of them the other day. The calling frequency seems to be 916.875, but when we switched them to private mode, both units changed frequencies when a link was established.

Sure can.

Remove two screws on bottom of battery pack.

Pry open battery pack. There are two snap tabs on the top but I
haven't found a way to open with out breaking them. Not a problem
though, a little crazy glue will hold the top together again.

Inside are six AA nicad cells with tabs soldered together in series.
You can replace with any AA nicads with solder tabs. RS has them but
I got mine from a local supplier that sold 800 mAH cells for longer
life.

Reassemble battery case.

I've done this twice on two battery packs with no problems. If you
don't use too much glue in reassembly you can open the case again
easily next time.

From the master of fast food, Bob Eisner:

Toy R Us wireless phone system

I came across a carrier today on 457.5375 and 457.5875 while
driving past a Toys R US store in Wheaton, MD. While I was
waiting at a stop light, the 457.5875 came active and I heard
some say "Toy R US Wheaton, may I help you." The 457.5875
frequency was Full Duplex (both sides) with the handset on
467.8125 (input).

The frequency combination in use is the same as those that are
allocated to Fast Food chains (like KFC 457.5875/467.8125). I've
seen various listing in the FCC files in the past the have Toy R US
allocated to 35.02/156.600 (same as McDonlds) was never able to find
out what this was used for. I think this may also be used for their
cordless phones in other stores across the country.

Please let me know if anyone else has come across this.

The New 3M Intercoms operate in the 902-928 Mhz range.
The Speaker (repeater) should be in the 920-922 Mhz range
The Headset (input) should be in the 903-905 Mhz range.

920.2625 WFM 903.2625 Dunkin Donuts
920.2875 WFM 903.2875 Kenny Rogers Roasters Chicken
920.5000 WFM 903.5000 McDonalds
920.7250 WFM 903.7250 Arbys
920.9625 WFM 903.9625 McDonalds

Special Industrial (GM Style headsets)

920.0000 - 921.0000 with 12.5Khz step WIDE FM (Speaker)
903.0000 - 904.0000 with 12.5Khz step WIDE FM (Headset)

Hi Brian,

I went back and verified the following for Toys R US in my area:

The UHF models operate on the following frequencies:

Base Unit Hand Unit

457.5375 468.6625
457.5875 468.7625

These appear to be slim black phones that look like Cell Phones
with small UHF type antenna.

The VHF-low/VHF-hi models opeate on the following frequencies:

Base Headset

30.8400 154.5700
33.1600 154.5150

These appear to be the same type of headsets that are used by
various Fast Food chains for their drive-thru.

Bob,

The Toys R US stores in Prince Georges and Charles County Maryland
use the following frequencies:

The UHF models operate on the following frequencies:

Base Unit Hand Unit

467.7625 468.5375
467.8125 468.3375

These appear to be slim black phones that look like Cell Phones
with small UHF type antenna.

The VHF-low/VHF-hi models opeate on the following frequencies:

From: KPerry <kperry@planeteer.com>
Message-ID: <329FB80E.3E1@planeteer.com>
Source record: 216301

I'm looking to purchase a new scanner and can get the AOR 2700 for $ 398.00 Canadian (approx $250 US funds).

This scanner has full coverage but am wondering how it performs in the real world and if I would be better off buying a Pro26 etc and doing a mod. for cell.

Regards

K. Perry

5242. AOR AR8000 Questions

Newsgroup: rec.radio.scanner
Date: 1996-11-29 00:00:00 UTC
From: bryant@aloha.com
Message-ID: <bryant-ya023080002911962134450001@news.aloha.com>
Source record: 216303

I am a potential buyer of an AR8000 and have a few questions:

1. Do all models have a problem with audio clipping in the 800mhz range?
2. Is there a problem with excessive birdies?
3. Are there any other shortcomings that might make me not want to get one?
4. What other hand held scanners have a simmilar range of freq's

--- Greg Bryant --- bryant@aloha.com ---

5243. discone or double discone?

In article <01bbdd5a$cf5d1640$457174cf@default>, "1" <ACABAMS@WORLDNET.ATT.NET> writes:
> THATS WHY FED EX IS #1 SHIP AN ITEM FED EX 3 DAY SERVICE COD.
> IS CLOSE TO UPS'S COST AND THEY QWILL FEDEX YOUR COD PAYMENT THE NEXT DAY
> TO YOU, AND DELIVER THE EXACT ITEM THAT YOUR CUSTOMER PAID YOU WITH!!!

I agree. I avoid UPS like the plague.

Other ways that FedEx is far superior to UPS:

UPS cannot, or at least refuses to, track shipments for the
recipient. "Tracking numbers" are unheard of. Where's my shipment?
What day is it likely to show up? They have no idea.

otoh, you can call FedEx, give them the tracking number for something
being shipped to you, and change the delivery instructions: Ask them
to deliver it a day later; ask them to deliver it on Saturday (you do
need to pay extra for this, but at least you have the option); or hold
it at their office for your pickup.

You can't do any of this with any certainty with UPS, because there is
no customer-visible tracking number.

And here in San Diego at least, the FedEx offices are open on
Saturdays, and it never takes more than ten minutes to get into their
office and get out with the item; UPS invariably has l-o-n-g lines.

I recently went through this with them, on an item that I couldn't
receive because I ended up having to be out of town on the days they
attempted delivery. I called them and asked them to redeliver on a
Friday when I WOULD be home. They said they would. I hung around all
day Friday, no UPS came. And I was going to be out of town the next
week too. I called UPS. No, we don't deliver on Saturday. Well, can
you hold the item at the office; I'll pick it up in eight days? No,
any item held at the office for more than three days is sent back to
the shipper; can't the driver just drop it on your front porch? No,
I don't want it sitting out there, and besides there's a COD charge
for customs, since it's an order from overseas. Well, we can't hold
it; we have to ship it back. Wait a minute, you'd rather spend your
own bucks to ship this thing all the way back to England, rather than
having it sit in your office for a few extra days? Well, sir, it's
not what we'd RATHER do, we just don't have any policies that cover
this...

AFter about ten more minutes of this, the operator finally agreed to
"send a message" to the local UPS office, asking them to please try
to deliver it on Saturday. But I thought you didn't ship on

Saturdays? Well, we don't from all offices. How will you associate this message with the shipment, since you have no tracking number? It goes by recipient name and address. Sh'yeah, right, I have to trust that they'll find it out of n-thousand packages in the warehouse.

But of course, she said, I don't know if anyone will actually READ this message before they send the trucks out on Saturday. Just great.

(Multiply this by at least a dozen other similar nightmares with other COD shipments.)

So I got to spend my Saturday, too, waiting around to see if the UPS man would show up with my shipment. Turns out that he did; he took the COD payment and everybody was happy in the end, but only after I'd wasted about a half hour of time on the phone and had to stay aruond the house for the better part of two days.

But I've never had things go anything like a tenth as wrong with FedEx.

I think the general public automatically thinks of UPS and not FedEx for not-business shipments. Maybe they think FedEx is just too expensive. They must place no value on their time or piece of mind.

I have often wondered about (and at times been bothered by) this issue.

I finally came to the conclusion that these terms--like other terms in the various "technical" fields--indicate that we actually have a rather limited vocabulary and tend to re-use terms for sometimes almost unrelated notions.

When I first got involved in electronics ("radio") years ago, I thought an ordinary radio path (using the common equipment of the day) was a "simplex" circuit--meaning useable in one direction at a time (the origin of the telegraphy symbol "K" and the voice symbol "over". A "duplex" circuit was on in which communications could take place simultaneously in both directions over the same path.

Then I got into wire-line stuff, and it appeared that the use of the terms depended on exactly what kind of communications was involved. In voice, these terms didn't really get used much, people talked about "2-wire" circuits with capabilities about like the "half-duplex" definition above,

and "4-wire" circuits with a definition a lot like "duplex" above.

In wire-plant circles, a "simplex" was the circuit that could be derived by using the center taps of the line transformers (or "coils") at each end of a 2-wire circuit. (2 "simplexes" could be combined to make a "phantom pair" (or just "a phantom").

In telegraphy, a "simplex" ciruit, was one that used a simplex and ground for transmisson in one direction or the other, and could be used alternately by agreement.

But a wire simplex could also be used to carry traffic in both directions at once (!)--called a "differential duplex" circuit.

Then "radio" folk started installing "repeaters" and called the practice of communicating only on the repeater output frequency (usually--sometimes the input frequency) "simplex".

I think you have to try to figure out what the "local" practice and convention is in order to know what people mean when they use these terms.

Can I switch a diode on the new Pro-43's to receive cellular frequencies
like with the old models? And can I do the same thing on any of the
other currently available scanners?
Any info will be appreciated,
-Sam

5248. Help w/ Military Satellites

Newsgroup: rec.radio.scanner
Date: 1996-11-29 00:00:00 UTC
From: jmoschel@earth.execpc.com
Message-ID: <57lv2c$3st@newsops.execpc.com>
Source record: 216319

I've got a few questions about Military satellites that I'm hoping some people in this group can answer.
First of all, all I have found about receiving satellites has been for American spacecraft like UHF F/O and LEASAT. Is there anything up there over the continental US that belongs to another country that we could listen to? (Cosmos, Raduga, etc.?) If so, where could I find information about these?
Also, I have only heard one military satellite signal since I bought my first scanner with mil. band. (I received that signal with a handheld antenna.) If I really want to become involved in this part of the spectrum, which is the best way to go with an antenna? Monitoring practices? My guess would be a helical of some kind, scanning all channels of a given satellite. I'd be interested to hear some personal experiences. How accurate would I have to be in the pointing of the antenna toward the MilSats?
Finally, what is currently the most active satellite in the Military band? What would I be most likely to hear? Is it even worth it?
Thanks for your responses - If I get some good answers I'll try and post some kind of miniFAQ since questions like mine surface once in a while. Thanks again-

One of the very best all-purpose programs for hobbyists, pro's, and
even small businesses is Microsoft WORKS for Windows. WORKS contains a
decent word processor, respectable spreadsheet, and nice database manager.
All three are interactive and work in harmony with each other.

All three are very flexible with respect to the kinds of files they can
import and export. And a bright spot is the cost....well under $100 with
$79 typical, but I've seen it discounted to $49 here and there.

Worth a look.

Rgds,

Bill

At the present, most handhelds receive cellular through images in the 894-920 MHz range. I use to own a Sportcat that did this, but 10 channels in each of the 10 banks didn't impress me. I have been giving thought to purchasing a BC230XLT. It use to be a BC220XLT so I wonder if it will pick up cellular. There was an earlier message that said they do.

What I really think is neat about this handheld is the fact that it has service searches for Police, Fire/Emg, etc. As far as I know, the Radio Shack handhelds don't have a Police search, but do have Fire/Emg, Weather, etc. It is also interesting to note that Uniden, who makes the Bearcats and Sportcat, make almost 95% of Radio Shack's scanners while GRE makes the other 5% like the PRO-2042 that I own.

Hope This is of Some Help,
Norvin Adams III

In Central Ohio it seems they have a very good system for interagency
comunication. There are several freqs agencies use for interagency
comms. Only recently has the Columbus Police dept become more
unrelaible. With their 800 Mhz system, evedently they cannot monitor the
main interagency freq and their own dispatch simultaneously. They can
contact whoever they want, when they need to, but most often when anyone
tries to contact them, they are greeted by silence.

James,

I've found that the most important part of an attic/outdoor antenna is the feedline. I installed a discone last year, feed it with approx. 90' of RG58 coax. It was terrible, my handhelds' rubber duck out-performed it in some frequency ranges.

Then I spent the big bucks & got some Beldon 9913 coax. It made a world of difference. UHF and above jumped out of my scanner! Good coax & the shortest run possible is where it's at for attic/outdoor antennas.

None of the currently availible scanners pick up cell freqs (although the AOR 8000 can be modified thru software).

I've used a Radio Shack PRO-62 with excellent results. 200 channels & a very "clean" receiver. It uses common AA dry cells or ni-cads (no expensive batteries to buy). It's small in size too.

I was wondering if the mobile extender warning is really useful. I mean, can this scanner be used in place of a radar deteactor (that is what the ads I've seen seem to imply).

Any advice is appreciated -- please post to group -- my email account is screwed up.

Austin

5262. Communication Link Terminology

Newsgroup: rec.radio.scanner
Date: 1996-11-29 00:00:00 UTC
From: mulligan@ACM.ORG
Message-ID: <57mtkb$nna@HOPPER.acm.ORG>
Source record: 216333

Lately I've been bothered by the use (and misuse) of the terminology
for communications paths. Way back in undergraduate studies I learned the
following terms:

Simplex - one channel supporting uni-directional communications, i.e.
a doorbell, P.A. system, or (in radio usage) a paging transmitter.
Dual Simplex - two uni-directional channels, supporting communications
in opposite directions, i.e. a 4-wire phone link or the use of separate
mobile-base and base-mobile radio frequencies.
Half Duplex - a single channel that can be used in either direction, but
not simultaneously, i.e. a 2-wire long distance phone line or the use of a
single radio frequency by both parties.
(Full) Duplex - a single channel that can be used simultaneously in both
directions, i.e. modems using different tones for originate and answer.

In casual use we tend to ignore the niceities and say simplex when
dual-simplex (or even half-duplex) is meant, and use duplex to mean half
duplex. I've even found the FCC regulations (a fount of excruciating detail)
sometimes use the same term to mean different things.

I'm wondering what people in the various disiplines (ham radio, telephony,
commercial two-way, etc) know about both the formal definitions and common
practice in using these terms. Have the meanings drifted since I learned the
basics (admittedly, back then B+ actually meant a B battery <g>); do different
fields have different usages; or am I just being pedantic?

The most common frequencies that McDonalds uses are:

35.020/154.600
154.570/170.245

However most of the ones in my area have recently switched
to 469.0125/464.0125

Source record: 216338

I believe the Percon database program allows you export a subset of records to another "DBF" file. So, using Percon, export all the Maryland data to another "DBF" file. Then, from within Access, use the "File" menu "Get External Data" command. Choose the "Import..." submenu option. In the dialog box that appears, set the file type to "Microsoft Foxpro" and specify the path and name of your Maryland "DBF" file. Click on the "Import" button and set back and wait for the import to complete.

After the import is done, be sure to go into "design view" for the resultant table and create indexes for the data columns (City, County, Service Code, Frequency, etc.) you will do most of your searches on. This will increase the speed of any searches and queries that you will do.

Scanners are the one thing RS markets that are perfect to
perfected. Strange. I'm told their computers too are very well
made, but their prices are sickening to consider based on the
prices most discounters and mail order charge....what I paid
for my 166mghz Pentium Multi-Media RS would charge around 3K
for....that's 900 more.

Remember: RS don't make em...they market them. BearCat makes
some and another company with three or four capital letters logo
makes them for RS.....

RS scanners are very sensitive and very well constructed. Too bad
the scanners don't reflect the "answer guys" who inhibit their
stores...most don't know much about scanners...just that you turn
it on and program it and then turn it off when through.

Ron ....

This new development just in....Santa Clara Sheriff is going
over to 800 trunked. Making the issue of listening in on any
SC prosti sting a mute point.

It's very difficult to listen in on Oakland's 800 Erickson
system when they do their runs wherever they do them against
the street whores...why?

Well, they have a set of frequences allotted which are not
listenable on scanner....used by UC operations. Plus I'd
imagine the Watch Commander, Lt. and like use them too.

That makes for a pretty closed Operation. No one can hear
what the op is up to....so no way to "JUST BE THERE" giving
one's support.

I also understand that when DEA and DOJ get involved in certain
stings they bring Encrypted Hand Sets along and give them to the
local police's OIC and that is how that is handled. All I ever
hear lately is "moving to location C from F"....or "we are now
with UC and awaiting paper to be faxed".... for those of you
who don't know what this means: tough!

PLus they have their digital radios or digital cell....DOJ and
DEA and FBI and more.....hard listening to what cannot be
heard.

Sorry but it is...

You can mod it so the US one picks up cellular in the 380Mhz atrea (or nearby I think) or you can purchase the European chip or logic board that has full coverage. See Javiations web site www.demon.co.uk/javiation/ for details.

To quote the page referenced -- "will increase the scan rate by about 60%" with the ultimate limit being how fast the synthesizer can lock. In addition, if I remember correctly, the Icom receivers have relay-switched band units which would require a considerable amount of time to switch. I assume the uP allows for this as well as watching for PLL lock detect.

This was my reason for getting the PRO-26 over the Bearcat as I didn't
really like the Battery pack situation. I think the 3000XLT is the better
radio but I have no problems with my PRO-26 and like its size.

If you want the full coverage version without cell block you will have to
go a dealer outside the USA. Try Javiation at www.demon.co.uk/javiation/

You probably already have the basics, but there are a couple
of websites that should be helpful:

http://www.frontiernet.net/~dstark/ NF2G Scannist Pages -
all 55 "upstate" NY counties, plus 6 Regional Municipalities
(so far) in Ontario

http://www.interlog.com/~ronkatz/ Ron Katz' site - he is
also in the news biz

I have links to a couple of others on my Links page - I
don't remember the full URLs off the top of my head.

Also, if you're near the shore of Lake Ontario from
approximately Scarborough to Trenton or thereabouts, you
might be able to hear the Western NY Scanner Listeners' Net
on Mondays at 8pm local time on 442.8 (110.9) or 146.925
MHz. We get a few checkins from Canada nearly every week.

Too narrow a definition for common usage. A single simplex
channel can be used for two-way communication, which is the
way most non-repeater communications are carried out. (In
ham parlance, the term "simplex" usually means "not on a
repeater" in normal conversation.)

> Dual Simplex - two uni-directional channels, supporting communications

Half-duplex and "Dual Simplex" are the same thing in radio.
What you describe as "Half Duplex" is considered to be
"Simplex".

Dual (or two-frequency) simplex is used by the New York
State Police and by VHF taxicab operators. Generally, units
transmitting on one frequency cannot monitor the other while
their mic is keyed.

> (Full) Duplex - a single channel that can be used simultaneously in both
>directions, i.e. modems using different tones for originate and answer.

On a radio system, full duplex operation is achieved using
two frequencies that are not combined into a repeater.
Stations on each frequency must be able to monitor the
return channel while transmitting. This is the way ALS
communications on the Med channels is done in my area (on
the rare occasions when they're not using cellular phones).

> I'm wondering what people in the various disiplines (ham radio, telephony,

I'm sure somebody will criticize you for that. :-)

The terms need to be descriptive of the communication system being discussed. If the technicalities match, so much the better.

"Mount" means whatever the judge says it means. In the
meantime, the police may have the authority to confiscate
your scanner until the matter has been resolved in court.

You people need to realize that you cannot just read the
statute and then believe you know exactly what the law is.
That is not how the (American) criminal justice system
works.

From what I have learned, the mobile extender is the in-car repeater in
varioius police cars. If they don't use their radio - just have a radar
gun aimed at you, or, if their repeater uses different frequencies, then
it is useless.

Anyone have a listing of the frequencies the 7 uses state-by-state? I
know Mass is using trunked 800 with some 30 Mhz still here and there. If
I knew what frequencies the 7 used, I'd know if it would be worth it vs. a
radar detector.

They can't be "illegal" unless they break the law.

Gathering evidence for later arrests by going undercover has
been held to be lawful and constitutional many, many times
by the U.S. Supreme Court and by State appellate courts in
just about every state.

The only thing the police have to be careful to avoid is
"entrapment", which is clearly defined in the law. In NY,
the law states that entrapment occurs when an officer causes
someone to commit a crime that the individual would not
normally be disposed to commit. Creating an opportunity for
someone who wants to break the law anyway (like prostitution
stings and undercover dope deals) is not entrapment.

(See NYS Penal Law Section 40.05 for the statutory
definition of Entrapment - and remember that these laws are
always affected by case law if there is any.)

My wife and I met when she was a Paramedic and I was a dispatcher. She used to have as much enthusiasm as I did for monitoring the action even when off-duty.

Then she was involved in an accident while enroute to a hospital with a patient and destroyed several disks in her spine. (She has had two unsuccessful spine fusion attempts.) There is no way that she will ever be able to go back to work, and she really misses being a Paramedic.

Now the beloved radios are "those damn scanners".

EEB carries a nice device that clips onto the fins of the vents found on most dashes. You then attach your radio to this device using its belt clip. I have one and find it very useful. I believe its the QS200 and sells for $14.95. Its all metal and has a rubber pad glued to the front surface to keep it from scratching the finish on the back of your radio when mounted.

5289. UPS COD - The check came today!

Newsgroup: rec.radio.scanner
Date: 1996-11-29 00:00:00 UTC
From: dconti@carroll.com
Message-ID: <E1nBun.C3q@news2.new-york.net>
Source record: 216360
Cross-posted to: alt.radio.scanner,rec.radio.scanner,rec.radio.swap

UPS finally sent me the $355.00 check due from a COD received by the purchaser on 10/21/96.

It was cut on Wednesday, and sent to me via UPS RED LABEL so I would have it today.

I would like to thank those here who felt my frustration and supported my efforts.

I would also like to thank the individual from UPS Corporate Customer Relations in Atlanta, whi initially swa my posts here, the individual in Customer Relations at the Secaucus, NJ facility, and another individual who is actively on line here, works for UPS, and helped to get the check red labeled to me, and therefore a resoution of this matter.

I will not mention their names as I am not sure if they want them posted publicly here, but these parties know who they are, and again, Thank You.

I am convinced that had it NOT been for my postings here in the groups, and these were only posted in THREE radio related groups, I would still be waiting for my money.

Numerous calls to the 800 number, which are usually NOT UPS employees, but telephone services contracted by UPS, apparently where forwarded to UPS by the services, but went unanswered.

I've learned that for regular shipping, UPS seems to run a tight ship. I've never had a problem with them in that regard. Others here have had packages lost or damaged, and based on the millions of packages shipped each day, I guess this will occurr from time to time. BUT, if you are on the RECEIVING end of this bad service, then you will feel as I did...that no one cared about serving YOU.

They seem to srping leaks in their ship with regard to COD, however. Apparently there is NO sure way for efficient COD service currently with UPS. Sometimes they send a Money Order directly to you, uncashed, sometimes they will cash a money order made out to you, and then cut their own check. It is hit or miss, and you cannot predict what or when they will do what. I've been told they are going to a new, more efficient COD system. Lets hope so.

Right now, FEDEX is the way to go for COD. I sent a package from NJ to North Carolina via overnight afternoon service on Monday. The package was received on Tuesday , 11:48 AM, the party paid the COD by

Certified check, and I had the certified check in my hands this morning, delivered to my door by FEDEX! I would've had it yesterday if not for the Thanksgiving holiday. Yes, you pay more..but for COD serv ice of this type, its worth it!

Anyway, I'm glad I finally have my money, and hope that information discussed during the course of these threads will help others in future radio-related shipping transactions!

Kenwood TK 805 D Commercial grade UHF mobile rig, 16 Channel with SCAN capabilities, 25 watts output. Will cover the 440 Amateur band up through 480 Mhz with NO PROBLEM. This radio is TOTALLY field programmable, no software or other equipment necessary to program in the field on the fly. Nice compact size, with Super audio, user defineable PL and DPL tones. MINT condition, in box with manual, and all accessories.

I have TWO (2) of these available...

$250.00 shipped to 48 states, will consider package deal on both...

Will accept pre-payment by U.S. POSTAL MONEY ORDER, OR will ship COD paid by U.S. POSTAL MONEY ORDER.

NO TRADES!

Contact vie E-Mail if interested.

Ive just got a few questions about my AR8000 scanner.

When I switched it on a few days ago the light was on and the 2 vfo freqs were reset to 80.000mhz. The unit was back to newuser as well.

What could cause this?

It seems to be working fine now except that since this happened I have to actually hold the FUNC key in instead of just pressing this once.

Any ideas?

jimmiew@sprynet.com (James West) wrote:

>I got my serial interface working .....

My previous post described a problem with the computer control done manually through a terminal emulator. After some turkey, pie, and hints from Doug Mitton I figgured out what was wrong. I didn't have the stupid caps lock on. The AR2700 expects all caps! Once I figgured this, all works well manually.

Then I tried to capture the Copy-Send again. All I saw on the terminal was a "%0000#". I got to looking at some AR8000 docs from the web and they showed the same thing. The protocols are very similar.

The scanner sends an address of the block of data it wants to send. The computer has to echo back the address, and then the scanner sends the data followed by the next address. Then this repeats till the transfer is done.

Just for yucks, I set Radio Manager for AR8000 and tried the upload function (only avaialable for AR8000). It kinda worked. It showed the transfer progress but bombed-out at the end apparently because the size of the transfer didn't match. Even if it did work, Radio Manager doesn't support downloading back to the radio.

So the process of uploading the EEPROM image, editing it, and downloading it isn't as straightforward as I thought. You need some kinda smarts to handle the handshaking. I suppose I could write a program to do this, but now I'm wondering if anyone has been down this path before me. Has anyone heard of a program to do this?

>
>Frank
>deluca@apk.net

Hi Frank,

My father has the same radio and I've determined it can't be modified
for all of 800 mhz. It was built after April 1994 and, by law, was
made to be unmodifiable for the cellular phone frequencies.

As far as the FM broadcast band is concerned even if you could get the
radio to accept the frequencies the reception would be very distorted.
The radio was designed for narrow band and FM broadcasts are wideband,
on the order of 150 to 200 khz.

By the way, you can use the image technique to hear much of the
missing gaps in 800 mhz.

You've encountered some of the problems with the AR8000. I haven't exeprienced the first, but I've heard that if you turn the scanner off while it is scanning on a pass frequency it will reset some of the parameters in the config menu.

The FUNC key is one of these parameters that it resets. It's called something line FUNC or 2ndF in the menu, just change that option and you'll be back to normal.

5307. Any Undocumented Features for BC230XLT?

Newsgroup: rec.radio.scanner
Date: 1996-11-29 00:00:00 UTC
From: Brian Webb <bmwebb@kiva.net>
Message-ID: <01bbddac$95471e40$d74561ce@default>
Source record: 216413

I have seen posts for undocumented features and tricks for the Bearcat BC3000XLT (buttons that are pushed while turning on the scanner). Does anyone know of any for the BC230XLT?

Thanks

Brian

Hi Ron....

well, seeing as how we are neighbors....the cops can arrest you
for soliciting a prosti, whether or not you pull your mouth down.
As I said before: they observe in their "observation unit" who
is responsible for "get that one" and ad infinitum. they then
wait for the guy to talk to the whore....he does, gets anxious
and back to his car and drives away.

Next week he returns and they do a 28 on him and wallah, he's
in their database....repeat felon in the making.

He approaches a prosti and gets anxious again and off he goes
down street. Comes back and talks to a whore and after about
five minutes the cops come out and bust the guy about five
feet from him talking "SEX" to a cop who is acting illegally
posing as a prosti....my opinion.

the bust goes down and in the sweep he's taken in. What were
you thinking Ron? He is asked for ID...governor Wilson says
if you don't have ID you will be arrested. Putting the two
on same venue, they arrest him.

But my car...i'll have to get a friend to drive it home.
They tell him not to worry...they'll see it done.

The only thing that is up in the air is this: he kept his
ID in his car. But they will not allow him to go over to
it to get his ID....and ad infinitum

I guess your dept don't do vice stuff with the losers of the
night anymore since they cleaned up Palo Alto....

And then they can do a search of his car because he is being
arrested adn if they should find a "whoosh...pass it around"
item, well, too bad. he has his car sold the next day.

All this from being stupid and thinking the talking to a prosti
with her ass showing is intelligent and fun activity.

what a free society we live in now....speaking is arrestable
when the Police deem it so...to their advantage...MONEY>

But then too, Florida is worse.

"WAIT!!!
>>DONT DO THE DEAL!!! THEY ARE ALL OUT TO GET YOU!!!"
>
>
> the moral of the story is simple:
first: have a brain.
second: have a plan
third: have a reason for not being there.

What is the answer: if on scene and looking and observing and
maintaining reasonableness in your car, the cops will leave
you alone...reading a paper, looking at a map book or many,
pretending to make a cellular call, etc.

What is not an answer: allowing the events to become more than
it is: work.

Your best bet is to Keep Your Scanner unseen. On Low volume.
Watch and observe and then tell someone later what you saw.
'
But also keep a camera handy...there may be gunfire and you can
make a good buck or more for those "action shots" newspapers
just love to publish or video that will make it on tv....

You never know.

There is a bad side and there is a good side and there is
their side and your side and all other asides. Besides,
it sure beats the hell our of watching MONDAY NIGHT FOOTBALL.

yes, that's what interagency frequencies are for, but the pol;ice rarely
use them..I do know that the Fire departments hee in Maricopa county do
use interagency frequencies..Phoenix dispatches for most
cities/communities in the county with the exception of Mesa, Scottsdale,
and a few other areas....

There have been several incidents..wshen I am home, I turn on my scanners
and it will become obvious that one agency does not know what hte other
is doing!

What about undercover drug officers who participate in this kind of thing specifically to get information on people they'll later arrest? Is this illegal too?

I'm not flaming, but I'm genuinely curious - do you think undercover ops of any kind should be illegal?

(We're getting *really* divergant from the topic, so maybe we should move this somewhere else..)

From: Rich Wells <rjwells@vnet.ibm.com>
Message-ID: <32A06978.2781@vnet.ibm.com>
Source record: 216175

Eric,
The Pro-51 is a fine scanner and is functionally equivalent to
the Uniden BC220XLT/BC230XLT radios which are very popular. The
major difference being that the 51 uses AA batteries while the
220/230 use a Ni-Cad.
Normally, the Pro-51 is way overpriced(IMHO) at $300. Compare
this to the 220 which can be had in the low $200s and you see
why since these radios are practically identical.
But the Pro-51 is currently on sale for $190, so now is the
time to buy if you're really interested.

Strong signals,

Not this product per se. But it sounds like a simple low power RF
modulator for the FM radio band. These have been around for quite
awhile by various manufacturers. They are legal, but have very low
power output. Don't expect to get too far away and get good results!

Ken,

Most Fast Food chains use their headsets for internal comms when
a customer places a special order. This accomplished via different
PL tones. Generally if the order taker is a teenager, they will
make comments about the person placing the order before they drive
up to the second window to pick up the order. You can also have
alot of fun sometimes, by responding to any internal comms that may
take place while you're waiting at the drive-up speaker. They think
they pushed the wrong button, and will wonder what went out over the
speaker.

Ken,
Yes, you can hear yourself, or friends order... but the big
thing
for me, is to listen for the off color remarks that the staff at the
drive thru make. One evening, while listening to a drive thru waiting
to
place my order, a friend of mine and I heard the clerks discussing
between themselves whether black or white women had better breasts. You
name it, you will hear it at the drive thru. The real fun comes when
you
freak out one of the clerks by commenting on something they say about
the
previous customer... they start worrying that they might have said
something that went out over the intercom to the customer... this has a
chilling effect on the clerks. There is also what others have posted,
the enjoyment of tracking down the frequencies. I have heard the clerks
make comments about the staff at the fast food store as well... so, it
is
very interesting. Just my $0.02...

Joe

Toys R Us has a floor walker that has a phone that looks like one of
those headsets that McDonalds uses. The floor walker runs around the
store to tell callers if certain products are in stock when they call.
These headsets are not "phones" but rather private uhf radios that hook
into the stores phone system. The headset are also used to talk to
other emplooyees back in the stock room and make pages over the stores
intercom system.

Anyway to answer your question about why?

The same reason mountain climbers climb mountains

Because they are there.

Bob

For some I think it's just the challenge of finding the frequency. I
hunted down quite a few frequencies at my Univ. that were very boring but
I just wanted to ID every signal out there. Once I found out, I logged it
and haven't listened to it since. Who knows when it could come in handy.

The V-Link phones as they are called are a very interesting form of
"kiddie talkie". I suspect these could be intended to compete directly
with UHF FRS radios. We got one the other day and played with it quite a
bit. Yes, 916.875 MHz is their calling/standby freq. They also have 15
other channels on freqs all the way down to 903.48 Mhz that they use on
an as needed basis for "private" links and depending on other
users/interference on the other CHs. They use good ol analog Wide FM (25

KHz deviation) for voice transmission. CTCSS/DCS is not used for selective(private) calling. Instead, they have a high speed digital ANI code burst that is sent at the beginning of an initaial transmission and anytime the CH remanins inactive for 10 seconds or so. The ANI data burst is apparently how the units instruct others as to what freq to switch to for private conversations.Hardly all too private though...One cute feature they have is digital voice storage, to save messages when the user is not available. I wonder if these might become popualr with certain drug gangs...

The transmit power level from the V-Link is only about .2 milliwatts, so I can't say they the reported "3 blocks" range is not streching it a bit far. Being a licensed Amateur, I have the option of removing the hardwired antenna and replacing it with an SMA receptical to permit attaching it to better antennas and or amplifiers

Excuse me...It is bs. Cops bust people with other people walking and running by and driving by and even laying in the streets....it's called: "reality of the streets"....

As a photojournalist I have been in on many good busts. some of them were really comical and others cops got shot or run over....but that was why I was there: to get the stills or video and that was my goal.

There is another angle to police and people who listen to scanners. People with scanners help catch crooks who the cops are looking for....think about this.

Cops don't really give much "weight" to a scanner. If they don't want to be heard, they have ways not to. There are so many now. And once the satellites get up and running for this purpose, they could care less about scanners. They will be obsolete.

Cops have an attitude when on a bust, no matter what. That is "staying alive". If someone is present who is making their job difficult it is life-threatening. It causes them to be a bit "HONERY"....

I've been hassled upon trying to get my video or stills on public streets many times. Just because I am there. On a public street, sidewalk. Many people going by and they single me out to be told to "get away from here". It's called WE TOLD YOU TO GET AWAY FROM HERE.

Legally, they cannot do it. But they can always do it other ways. Many ways.

In the end it is this: Best to stay away from any cop undercover operation that has not been concluded. Once they are, they call in the uniformed cops and then it's ok to GAWK.

Myself, I usually stay at least 1/4 mile away out of their sight until I know the arrest is going down. This is known based on the methodology they use when involved in bust's. Best this info and skill be kept guiet amoungst us professional photographers who are able to deal in this environment.

5347. SCANNER LISTENER BUSTS CLW. FL. PROSTITUTION STING!!!!!

Newsgroup: rec.radio.scanner
Date: 1996-11-30 00:00:00 UTC
From: atocco8586@aol.com
Message-ID: <19961130044000.XAA19289@ladder01.news.aol.com>
Source record: 216227

This post is a follow-up on a previous message titled "SCANNER ACTION BUSTS UNDERCOVER PROSTITUTION STING"

The story from the origional post goes somthing like this;

Clearwater Fl. police officers were running a prostitution -sting. I will explain my understanding of how it went. A female undercover cop was standing around in skimpy clothing (aussumption here is that she is trying to look like a hooker). Cars would stop in the vicinity of this undercover cop, sometimes the undercover cop would approach the stopped cars and engage in conversation w/the passengers and/or drivers(prospective johns) of these stopped cars. A scanner listener was listening and apparently the story goes on. The conversation between the cop-hooker and the prospective john was being transmitted via a wireless mic. to another cop inside an unmarked ford bronco. When the cop inside the bronco heard what he considered to be just cause to issue a citation, or make an arrest, he would dispatch a marked car with a uniform officer to stop the alledged john somewhere down the road and inform him of the situatiuon (cite or arrest). The scanner listener stopped HIS car about 30 yards from the cop-hooker. The cop-hooker walked up to the scanner listeners car and said "watcha doin'?" the scanner listener said "nothing" the cop; "i'mmmm woorrrking" listener; "so?" cop; "I work the streets". This went on-and-on until the cop asked the scanner listener "are you a cop" the scanner listener said "no, are you" the cop said 3 times "no i am not a cop" (lesson here, cops ARE allowed to lie about this). It was really unreal what the cop lady said to try to get the prospective johns to offer cash for sex. The scanner listener finially let it be known that he had a scanner by showing it (the scanner) to this lady cop, and saying "i feel as if i am being entraped". The cop lady walked away, the scanner listener drove away. The scanner listener was stopped shortly and was asked "what were you doing talking that girl" listeners reply; "what girl" cops; "that girl back there" listener; "she was doing most of the talking, i felt like i was being entrapped" cops; "whats the scanner for?" listener "why do you care what the scanner is for, its not illegal". After they told the listener he was free to go, they asked to take his picture. The listener said "sorry, i'm free to go, you will have to catch me on your next entrapment mission, and i am being video recorded whenever i am doing this.++++++++++++++++++++++++PROBLEM W/AOL+NEWSGROUPS, OR NEWSGROUPS OR SOMTHING.++++++++++ I posted this a number of days ago and started getting responses the next day(via e-mail), but could not find the message or responses(on the news group) till today, and there were 31 responses. I did not have time read and respond then so i looked again tonight for the "message" or "subject or whatever, and it was gone. I will try to address now, as best i can, each issue of concern or opinion i remember seeing earlier.

I am very interested in different opinions and responses to this situation.

Someone said it was a foolish thing to do because it endangered the life of the under cover hooker-cop by blowing her cover. My position is that the scanner listener did not put the lady in any additional danger. The scanner listener did not let it be known to anyone else that the lady was a cop, he just drove away. Did not make a scene or anything.

Lots of people scolded me for putting the message on the group in ALL CAPS. I apoligize i am just lazy and hate typing in grammatically correct form. I will not use all caps anymore if it offends anyone, sorry. Please also excuse my occasional spelling errors.

Some folks said it was things like this that cause laws to be passed against scanners in cars, or scanners anywhere.Cops dont like scanners because cops dont like people to know what they are doing or saying. Why is this? I say it is because cops do things that violate peoples rights, sometimes things that violate the law. Even without folks riding around busting prostitution sting operations, cops still dont like scanners and will try to have laws passed against them. We need to use scanners to keep cops in check. The cops are supposedly there to "serve and protect" us. I remember hearing that we have the right to observe public servants in the lawful execution of their duties (but they will imply or straight out tell that they will arrest you if you continue to observe them breaking the law). They often dont like people to watch, because their duties are often not lawful. Same with listening on a scanner.

Some folks said any scanner listener doing this could/should be arrested for interfering in a police investigation. My position on this is that when the cops do illegal things, the cops should be interfered with. There are such agancies as internal affairs, that claim to police the police, watch the watchers. Fact is that they usually dont. It is the job of the watched to watch the watchers. Most citizens dont want to get involved when thay see police abuses. This is why the police confidence in their ability to get away with violating more and more peoples rights will grow until the day comes that YOUR rights are violated. I truly hope that when this happens, someone sees it, and wants to help.

Some folks doubted the truth of this story, my position is, call the Clearwater Fl. p.d, and see if you can tell by their tone if it is true or not.

Some folks just said "get a life" to this i would respond, be more specific, and i will reply.

I AM VERY INTERESTED IN READING OPINIONS FROM YOU GUYS ON THIS. I AM LOOKING FOR CONSTRUCTIVE CRITISIM/DEBATE. I DONT WANT TO ARGUE WITH OR OFFEND ANYONE.----------please e-mail me with responses, as well as responding to the group because of problems i explained above.

happy scanning, and i hope to hear from you soon.

tony

Blake...you are very obtuse. Very small minded. Lacking proper
mind-stem connection. I kept the subject based on what the
original post was about....there are other kinds too, but this
was the key thought.

Learn how to discern. Learn how to decipher intent. I speak
from direct experiences based on my being with scanners and a
goal to get the arrest on still or video.

It's you. You have no scope and really have limited access
to the real world of Cops and Street Fun. It is your lack
of imagination that created this angst for you here. It is
your being opaque that creates this "chasm" between what is
there and what you never will know about even when told about.

Create a space for your mind to grow. Your awareness is very
limited. Very stilted. Very lacking . Very juvenile.

enjoy

bill

Radio Shack(which has its scanners made by GRE of Japan and Uniden)
are very nice. I tell most people that they do tend to be overpriced
at their normal retail price. You are better off to wait for a sale
or do mail-order to get big discounts on them.
I currently own a Pro-26, 34, 43, 51, 60, 2006 and 2042 and am
happy with them all. The 26 and 51 are made by Uniden while the others
are made by GRE(I think). The Pro-34, which I bought back in '89 is
still ticking along...although VERY SLOWLY by today's scanner speeds.
The Pro-60 is the successor to the infamous Pro-43 and is on sale for
a bargain price(IMHO) of $250. It is a nice triple conversion receiver
with wide frequency coverage.
The 2042 is the BC9000 competitor. The Pro-51 is also on sale for
$190 and is practically identical to the BC220/230. The Pro-26 is also
on sale I believe($369?) and is the BC3000 equivalent.

Strong signals,
Rich

I have a Bearcat 220XLT with extra battery pack (but not the external battery pack charger) and Uniden protective cover (both don't come with the unit). Unit has original packing, manual, like new condition with all accessories (less earplug).

Basically, I've got too many scanners and trying to clear some out.

Asking $170 + s/h. Please e-mail if interested.

> 3. Are there any other shortcomings that might make me not want to get one?
> 4. What other hand held scanners have a simmilar range of freq's

Just got my 8000 last week. Here's my thoughts so far;

Item #1
The audio clipping seems to be related to signal strenght. When using
the 8000 w/ a mag mount & 10' of cheap coax, there's almost no clipping.
When I put on a good whip it clips.

Item #2
I don't think their birdies per say. The AOR 8000 seems so sensitive
that it picks up weak signals as "birdies". When driving approx. 1/2
mile from the local mall I get a couple of birdies in the 150 MHz range.
If I drive to the parking lot it receives these mall freqs. as it
should, if I drive farther away, these "birdies" go away.

Item #3
The user interface is not as easy to master as RS or Uniden stuff :-).
Don't buy the 8000 for MW (AM)listening. Strong SW stations are OK,
makes it easy to listen to the BBC in the car!

Item #4
I looked at the Radio Shack Pro 26 & the Uniden 3000 but thought both
where short of features & frequency range compared to the 8000.

>I believe the Percon database program allows you export a subset of
>records to another "DBF" file. So, using Percon, export all the Maryland
>data to another "DBF" file.

Yes, it does, but it is still not that simple. The Percon has poor search/retrieval capabilities and you cannot simply export an entire state in one shot (you have to do it county by county). That may not be a problem if you live in say, Rhode Island! But if you want to extract freqs from a big state or a couple or a few states, then what you have to do is copy the entire CD to your hard drive, then use Access to extract the states that you want. It takes forever to do this but it was the only way that I could find to get all of the options that I wanted. Once you have the states that you want, you can delete everything else to free up the HD space. Fortunately, it gets faster and faster as you refine your searches so that once you have everything set up, it's a snap to do stuff like get freqs of police in specific towns, and do other sorts of searches that the Percon disk can never hope to touch.

You have to think of the Percon disk as an electronic book of freqs, not as a database product. I would recommend to anyone contemplating getting this CD to expect to have to transfer it into a real RDBMS.

I suppose it has much to do with your area and the number of users. I
like to scan cell calls just to hear all the various types of human
pursuits. Business, romance, anger, political planning, etc.

But the main use I have for scanning cell occurs when the weather gets
bad here in Minnesota. A half hour of scanning while having my
morning coffee, listening to police, plow trucks, amatuer band and
cell will give me an exact picture of conditions and areas to avoid
with far more precision than anything the local weather report can
match.

Jamie: Two years ago I had to give a presentation in upstate New York and I FedExed slides to our office up there. When the package didn't show up the day before the presentation, called FedEx and found the slides got misrouted to someplace in New England. FEDEX RETRIEVED THE PACKAGE, QUICKLY PUT IT ON A COMMERCIAL FLIGHT TO WESTCHESTER, HAD A COURIER PICK IT UP, DRIVE STRAIGHT TO THE OFFICE AND DELIVER IT. With time to spare, too.

Now THAT'S service!

Have also found that they will make multiple attempts in one day to deliver a package. I have also found that UPS couldn't care less and is hidebound by "rules". FedEx people are given a lot of leeway to be creative to "get the mail through." Believe me: I will pay the premium for FedEx!! It's worth it!

Get the PRO-26!!! THe 2700 looks great on paper but it's miserable. It has birdies galore and is useless for searching. It's also not very sensitive. If you get the 26 and think you really want the 2700, get a hold of me I will GLADLY trade you;-)

I think most of us would recommend that you stay away from the 2700.
Your money would be better spent on a Pro-26 or BC3000. If you want
cell coverage, you'll have to buy it that way since these can't be
moded to receive.

Johnny,
The major players these days are Radio Shack and Uniden. As for
Radio Shack, their scanners are made by Uniden and GRE(Japan). There
are also scanners made by AOR, Icom and Yupiteru but these are quite
expensive.
Today's scanners can not be easily modified to pick up cellular
frequencies as per US regulations. This leaves you with three options :
1) Forget about cellular
2) Buy a used scanner that can or has been moded to receive cellular
3) Buy from an overseas or import dealer that sells these radios
without the cell blockage(expect to pay more than the equivalent
US model for this "premium" scanner). Popular models here include
the Pro-26, UBC3000XLT and UBC9000XLT

5370. BC-200 Scanner, Mint Condition, For Trade

Newsgroup: rec.radio.scanner
Date: 1996-11-30 00:00:00 UTC
From: Radioman@localnet.com
Message-ID: <57pqn8$d67@prometheus.localnet.com>
Source record: 216250
Cross-posted to: rec.radio.scanner,alt.radio.scanner

Have a mint BC-200 (cell-mod done) with leather case, charger,
antenna, manual, original sales ticket, & box w/packing. I would
like to trade this for a likewise mint radio shack Pro-43 handheld
scanner. The Pro-43 would have to be date code 2A4 OR EARLIER. I may
consider trading the BC-200 for a different scanner than the Pro-43,
provided that it meet the criteria of 200 channel; cell modifiable;
and, of course, be in mint condition. If you are interested, e-mail me
at radioman@localnet.com with complete details of what you have to offer.
Regards,
Ray Miller N2NJK

The date code of 7A6(July of '96) means that is unmodifiable. So
you can forget it if the date code is later than, if memory serves
me right, 5A4(May of '94)?

Strong signals,

5373. Hamden, CT "signal codes"

Newsgroup: rec.radio.scanner
Date: 1996-11-30 00:00:00 UTC
From: phoeg@sprynet.com
Message-ID: <32a0b065.2434111@news.sprynet.com>
Source record: 216253

Anyone familiar with the Hamden, CT area police signal codes? (i.e. signal-seven, signal fifteen, etc)

I can usually get an idea of what they are once they elaborate a little, but if anyone in the area has compiled a list I'd be interested.

Thanks

Oh, I don't know. I use http://www.ups.com to track all my UPS shipments and I have never used them when I wasn't given a tracking number.

I agree that trying to change the normal flow of a package can be difficult, but keeping track of them is possible.

5376. Re: Tape recorder problem...

Newsgroup: rec.radio.scanner
Date: 1996-11-30 00:00:00 UTC
From: dschmidt@rain.org
Message-ID: <32a0905e.1573052@netnews.worldnet.att.net>
Source record: 216256

I've had problems with my just about all my tape recorders when I use
a chrome, or metal tape. It seems that when the tape head overwrites
new audio, the old audio is still faintly present. I would guess that
the erase head isn't strong enough for metal/chrome tapes, but it also
makes me wonder if the read/write head isn't strong enough to change
the magnetic domains properly on the tape.
I keep my heads cleaned, demagnetized, and only use NORMAL bias
tapes. Once in a while I will bulk erase a tape using a bulk eraser
that plugs into the wall. Works fine!

BTW, I also have modified my tape recorders to record/playback as slow
as possible.

>>

Yeah, I completely forgot about that.

Perhaps an alternative to copying the entire CD to the hard drive would be to create an Access table with the same structure as the Percon CD. You may choose to only include certain columns (fields) of data from the original database table. Then establish a link to the Percon CD table by selecting "Get External Data... / Link Tables..." from the File menu. Then go into query design view and create an Access "Append Query" (select "Append..." from the "Query" menu) to bring in the records you want. Run the query and after it's done, kill the link to the external table.

A tip: Don't create any indexes on the your Access table until *after* the records have been added to the table. This will save a considerable amount of time.

Yes, It can be modified. I just did one last week. Read the following:

From: steuer@clam.rutgers.edu (robert Steuer)
Newsgroups: alt.radio.scanner
Subject:
PRO-2026 MODS!!!
Message-ID: <Oct.20.10.55.49.1992.11077@clam.rutgers.edu>
Date: 20
Oct 92 14:55:50 GMT
Organization: Rutgers Univ., New Brunswick, N.J.
Lines: 29

Hi
all, just got these mods, hot off the FAX!

Note: It is not lawful to monitor cellular or conventional mobile
telephone
conversations.

The 2026 has cellular frequencies deleted at the factory,
but
restoration is the easiest ever! - clip one marked wire! All you need

is a
Philips screwdriver and wire cutters.

1. Turn the scanner u
pside-down and remove the four side screws
holding the bottom cover in place; pull
the cover loose and set it
back about two inches out of the way.

2. Locate the small
circuit board at the lower right-hand corner and
find jumper L201. Cut it and
slightly separate the break.

3. Reassemble the
radio which now has continuous 806-956 MHz coverage
and 30KHz search increments in
the cellular band.

*** I have not tried the above mod, but did acquire it from
a
commercial radio dealer who is very respectable, so as always, proceed
at your own
risk and realize that this will violate your war
ranty!

Have Fun!

thnx bob,

whe have for the area of south limburg just one freq.:

INRAP-NET

ENGLISH: police comunication-net between germany, netherland, belgium
DEUTSCH: Polizei Verbindungsnetz fuer Laenderuebergreifende Fahndungen

468.1900mhz

Niederlande: Maastricht, Heerlen, Kerkrade
Deutschland: Aachen
Belgien: Eupen, Tongeren

---

in the future, dutch police will operate directly on german freq.
it's not clear yet, with what equipment.

all other german and belgium freqs. (incl. royal palace guard ;-) are available
on our list-server, instruction for use are frequently reposted in
de.alt.radio-scanner.
dutch freqs. are not available at the moment, but planned for the future.

regards

harry dutch of cloggyland ;-)

Well been waiting for the reviews to come in.
A couple fast thing on the PL/DPL it has it but you can NOT search for a tone or tune tru to find the right tone.

You either MUST know the tone the freq needs or sit there and enter the freq then each tone till you hit the right one.

Oh well atleast it has DPL/PL.
Very sensitive in fact for ME with stock Rubber duck ant I get too much overload inthe 800 MHz band.
I am going to try diferent ant.

Oh in search mode when you are searching between two freq and want to lock out up too 100 freq you can do this.
Only starnge thing they did you can't easliy UNLOCK them back,you must re enter atleast ONE of the search limits this starts it all over.

Any questions on thei brand just email or post.

Jeff

I've done this and it works - Access can easily link to one of the
Percon tables since they're in Foxpro (or dBase) format. I created a
'make table' query that grabbed the fields that I wanted and filtered
out the records that I wanted. This query took quite a while to run, but
once it was finished, I had an Access table that I could query very
quickly. You don't need to create the Access table first - the query
does it for you.

Below is an automated script for the CE-232 Interface donated by
Mr. Rich McNamee. Simply cut out the below text exactly between
the "cut here" lines and save it in your CE-232 Script directory
as the filename LINK123.SCR and then run it at your pleasure.

This script effectively links three SEARCH Banks into one on your
CE-232-equipped PRO-2004/5/6 scanner. A slight modification could
link for or more including all ten Search Banks into one.

Have fun!

Bill Cheek
COMMtronics Engineering

```
====================[ cut here ]=========================
/ LINK123.SCR Rich McNamee (K2QG) 30 August 1996
/
/
/ This script will link three search ranges 1, 2, and 3.
/
/ The upper frequency limit for each search range must be an
/ exact multiple of the step size or the end of the search
/ range will never be seen by the script. If that is allowed
/ to occur the script will "stick" in one search range.
/
/ In an attempt to make this easier in the 869-894 mhz
/ range, the script forces the step size to 30 khz and looks for a
/ frequency greater than (upper limit frequency - 0.030 khz).
/
/ In all other frequency ranges, it is up to you to ensure
/ that a valid upper limit is entered.
/
/
/ NOTE: Occasionally, the script will "miss" the upper limit
/ frequency. This will cause the current search range to be
/ be repeated more than once.

I JUST PURCHASED AN ICOM R-8500 RECEIVER THAT I HAVE WAITED MONTHS FOR.
NICE RADIO! DOES ANYONE HAVE THE 800 MOD FOR THIS RADIO? ANY HELP WOULD BE
APPRECIATED.
MY E-MAIL ADDRESS IS : PETERSONMD@AOL.COM

The only one I remember is 460.175 for the aircraft on highway patrol. I visit the Hayward area every year and monitor the state/county police patrols. I've heard this freq used most on the weekends. Scan the 151-152 range for DNR. Scan the 153-156 range for police and fire. State police on 154.680, 154.905.

5392. 12 volt batt for PRO 2026 for memory retension?????

Hi, I am considering buying the older model pro 2026. It does not have a memory feature and if power were cut, all freqs would be lost. I have heard that you can hook up a 12volt battery or something to keep power if you move the unit from mobile to base (ie car to home) and back and forth. Also, it has no ac power adapter, can I still use one? Anyone who has used this, any ifo would be appreciated. Thanks

First, have you cleaned your tape heads with alcohol. also stick with
high bias tapes (ie Maxell) some lousy tapes leave crap on the
heads.What type of recorder is it?>

5394. Scanstar tech material/support - not good...

I bought the Scanstar Advanced from Grove for $159. When I received it, I was quite disappointed that it had half baked directions, which lasted a whole 6 (yes six) pages. Obviously I was on my own. When I did have a question I called the "tech support line" Believe it or not the guy on the other end was talking from a cel phone! When I had more problems with the COM port on my laptop I called again, and again and again 3 times to be exact with no reply. I feel taken. Has anyone had similiar situations with "Scum"-star like this? I'm moving to Scancat....

Is it just me, or does anyone else get the idea this guy spends way
too much of his time around prostitution stings?

the road. I takes a little findling around=
to get the CD sound in. Periodically you have to retune the knob, and sometimes, the radio
station that its canceling out bleeds t=
hrough. Its a distraction when you are driving. Why do you want to hook up a scanner to it?
